Toussaint, relying on the captain-general's honour, lived happily with his family on his plantation near Gonaives; had not his two sons been still detained as hostages: of their fate no intelligence was ever received. The retirement of Toussaint was of short duration. The perfidious Le Clerc caused his house, at night, when asleep, unconscious and unsuspecting, to be surrounded by troops, who dragged Toussaint from his bed, from his faithful wife, and beloved children, and carried him immediately on board a French frigate. He submitted to his fate, and left it to his countrymen to avenge his wrongs. He only asked for the protection of his family, but they were soon hurried on board the same frigate, and sent to France to perish in a dungeon.

Thus terminated the career of Toussaint l'Ouverture. History can scarcely afford a more base and unjustifiable act of perfidy. It was awfully avenged.

After the atrocity committed on Toussaint and his family, Le Clerc, about the end of June, 1802, issued regulations for a new form of government.

CHAPTER V.

REIGN OF DESSALINES.

No sooner was the seizure of Toussaint known, than Dessalines, Christophe, and Clerveaux, flew to arms, and called the cultivators and all others to join their standard, to revenge the atrocity committed on their chief, and to defend themselves against the French general. In a few days, they were at the head of a large force, well armed and equipped; and they determined on a most desperate struggle for liberty. The French troops were hourly diminishing from disease. The officers were dying rapidly, a disaffected spirit had manifested itself, and not only the privates and subaltern officers deserted their standards, but even generals followed the example. Scenes of horrible carnage and destruction followed. The atrocities of the French are said to have exceeded those of their negro opponents. Blood-hounds were brought in by the French, but the negroes were prepared for them; and although, in some instances, they tore some persons, and devoured a child or two, yet were shot in great numbers, and rendered useless, from the negroes having been always prepared to shoot them.

In the plains near the Cape, and in the city, the massacres by the French were indiscriminate. Scenes of carnage and destruction seemed to have reached their height, when the French force began rapidly to diminish from the effects of a pestilence which soon raged through the whole army. The general-in-chief, Le Clerc, died from disease on the 1st of November, leaving to memory a character, in which were assembled almost every crime, unredeemed for by one single virtue.

The command of the army devolved on General Rochambeau, a worthy successor of Le Clerc.

In the early part of 1803, nothing was decided on either side. Rochambeau and Dessalines fought a battle, in which the latter was victorious. Carnage and massacres followed. The French general, who took about 500 prisoners, put them all to death, careless of the fate of his own soldiers in the power of his enemy. The latter retaliated; and on the following morning, at day-break, on as many gibbets, there were exhibited 500 French officers and men sacrificed, in retaliation for the savage conduct of the French general.

War having broken out between England and France in July following, a British squadron appeared off Cape François, and blockaded the harbour. This force accelerated the expulsion of the French. The squadron precluded the possibility of the French receiving any supplies. The garrison and inhabitants of the city were reduced to great want and distress. Horses, mules, asses, and dogs, were devoured.

Preparations being made to take the city by storm; the French commander-in-chief offered to capitulate. Dessalines received these proposals; and arti-

cles were signed on the 19th of November highly favourable to the French : for they provided for the security of private property, and that all their sick and wounded should be carefully attended to by the blacks, and afterwards conveyed to France in vessels bearing a neutral flag. For the evacuation ten days were allowed, and Rochambeau thought that the strong and stormy winds which prevailed during the autumnal months, might blow off the British ships, and enable the French squadron to steal away unperceived : but, finding it impossible to elude the British squadron, Rochambeau was obliged to capitulate with the British admiral ; and his squadron of three frigates and nearly twenty smaller vessels, each with the prisoners to the number of about 8000 men, were taken first to Jamaica, and afterwards to England.

Thus ended the war for the recovery by France of St. Domingo. Upwards of 40,000 men, which arrived from France at different times were defeated, and about three-fourths destroyed.

In the end of December, 1803, the negroes and coloured people of Hayti were in quiet possession of the island. The successors of Toussaint had not that influence over the cultivators which their predecessor commanded. Neither persuasion, nor the expectation of gain could prevail upon labourers to return to their agricultural employment : and immediately after the war, it would have been impolitic, if not utterly impracticable, to have enforced it.

Commerce had been suspended, from the want of articles of exchange for the manufactures of Europe, and the provisions of America.

Toussaint certainly made great efforts to revive commerce as well as agriculture. He promoted both to an extent which, when the state of the country and the agitation of the people are examined, appears surprising. The system adopted by Toussaint was not dissimilar to that which prevails in Russia, where the peasantry are "*adscripti glebæ*." He acted wisely, though severely, for the benefit of his people, of whose innate love of indolence, he was no mean judge. If he was severe in his anxiety to promote industry and exertion, he was impartial.

The population of Hayti at this period had greatly diminished ; the natural increase had been very small, and the ravages of war had created a great decrease of numbers, exclusive of the emigration which had taken place under the protection of the French. The number of the population in 1802, as estimated was 375,000 ; of which 290,000 were cultivators, 47,700 domestics, sailors, &c., and 37,300 soldiers. By a subsequent statement of the population of the island in the year 1803, immediately after the expulsion of the French, the number appears to have been about 348,000, of which 272,000 were cultivators, 35,000 soldiers, and the remainder were composed of domestics, artisans, and a few sailors. The difference, between these two statements of 27,000, in so short a time appears large, but the destruction of life was very great. The emigration to the Spanish part of the island was considerable. Many fled there to save themselves from a fate which awaited those who had wavered. The successors of Toussaint

they believed would visit them with capital penalties; and from the ferocity of Dessalines they had little mercy to expect.

Dessalines declared Hayti independent on the 1st of January, 1804, and the first steps taken by him on being elected to the chief command, were to endeavour to prevent emigration,—to remove delusions under which the negroes were oppressed,—to make it generally known, that all previous opinions and transgressions should be forgotten,—and to invite back those who had been allured to take part with the French, and who emigrated in consequence; assuring them protection and security. All those who were disposed to accompany the French army were freely allowed to depart; and many took advantage of this clemency, who afterwards had to regret their credulity.

A proclamation, signed by Dessalines, Christophe, and Clerveaux, a mulatto (in which the independence of the colony is declared), encouraged the emigrants to return to their properties, and further declares, “towards those men who do us justice, we will act as brothers; let them rely for ever on our esteem and friendship; let them return amongst us. The God who protects us, the God of freemen, bids us stretch out towards them our conquering arms.” Many were allured by this promise of security and protection, and returned from the interior fastnesses to which they had fled.

Hayti, the name given to the island by the aborigines, was adopted by Dessalines, instead of St. Domingo, and he demanded that the people should execute vengeance upon their former oppressors. The white French people were indiscriminately massacred by the troops, and by command of the monster Dessalines. No age or sex was spared. Females were first violated, and then bayoneted and shockingly mangled.

This execrable tyrant, proclaimed that he intended to stay his vengeance, for the sufferings to which his brethren had been exposed, and that all those who had escaped execution under this military decree, should meet for the purpose of receiving protective papers, which would secure them from the vengeance of the people. Unsuspecting and deluded, they came forth from their hiding-places to the place announced for issuing the protecting tickets: they were then immediately arrested and executed.

He also concerted measures for the reduction of the Spanish division of the island, in which there were but few slaves: and those being mildly treated, slavery was only known by name. The people and the few slaves therefore united to oppose the tyrant Dessalines, should he appear before the city of St. Domingo. He laid siege to the city, conceiving that the terror of his name would dispel any resistance. But the besieged had determined, by vigorous efforts, to repel him. A reinforcement arrived soon after from France, and Dessalines raised the siege and retreated to the west.

On his return from St. Domingo, he was, or rather caused himself to be, on the 8th of October, 1804, with great parade, crowned “Emperor of Hayti.”

A new constitution was promulgated, and in it there were articles, showing, on the part of those who framed it, a desire to promote the happiness and improve the condition and morals of the people. By it no Haytian was entitled to the privileges of a citizen, who did not inherit all the qualities of a good father, a good son, and a good husband. No child could be disinherited by his parents; *emigration subjected a person to the loss of his citizenship, and a citizen becoming bankrupt lost all his privileges; all citizens too were required to make themselves skilful in some mechanical trade.* Such enactments as these did credit to the persons from whom they emanated; and Dessalines consented that they should form a part of the fundamental laws which he had sworn to observe, and by which he engaged to govern. By the new constitution, religion was tolerated, although it was declared that there should be no predominant religion. Marriage was declared to be merely a civil ceremony, tending to improve society, and to inspire the people with a disgust for unlimited sensuality so prevalent in the country.

Dessalines was, without an attempt at contradiction in his favour, the most atrocious monster of cruelty that ever appeared in Hayti; yet he possessed uncommon powers of mind, and when he had committed his indescribable massacres and tortures on the French people, he really endeavoured to encourage agriculture and commerce, and consulted citizens of the United States and others on these points. After his coronation there was peace for some time, and people of colour and the negroes began to return to their homes; others from the French and British colonies came back. In order to increase *the male population*, he wished to enter into a treaty with the British agent from Jamaica, "offering to open the ports of Hayti to the British slave-ships, and to grant to the Jamaica importers the exclusive right of selling negroes in Hayti! The privilege was to extend to the importation of men only, and that they were not to be sold to any other person but those appointed by the government, which, it is said, wanted them to increase the military establishment," but, in fact, for the cultivation of the government lands which had fallen from neglect into a state of unproductiveness. This proposal was rejected by the British agent. Dessalines contended, "that it was a measure of necessity, of political expediency, which, at least, *with him*, superseded every other consideration; that he should be performing an act of humanity towards the African race, by bringing them into his dominions instead of their being taken to Jamaica and other islands as slaves."

In 1805, the population of Hayti was estimated at about 400,000, of all denominations, so that by births and by emigration from other countries, there was an increase in three years of about 25,000, taking M. Humboldt's statement of the population in 1802 to be the most correct estimate.

The rural agricultural code of Toussaint was enforced by Dessalines, but with some alteration. The cultivators were permitted by Dessalines to change the estates on which they had chosen to work, on representing their wish to the

commanding officer of the district, and by proving to him a sufficient cause. The code of Toussaint, as acted upon by his successor, was severe in the extreme, especially on the government estates. Dessalines knew well the work which could be performed by one labourer, and had a daily return sent in to him of work done, and if there had been any diminution from that of the day before, he often sentenced the negro defaulters to hard labour on the public roads.

The greater portion of labour was directed to the cultivation of coffee. The sugar plantations had been destroyed, and the sugar works demolished. Little sugar was made, in proportion to the quantity produced in the time of the French.

Dessalines, although considered an infidel, enjoined all persons to celebrate public worship, and observe the Sunday. This was merely policy for preserving order. He observed in his own person the forms of religious worship, as an example to his subjects, not from regard for religion. He encouraged marriage, and rigidly exacted obedience to its injunctions, and publicly condemned sensuality and voluptuousness. In his own person he is asserted to have been depraved and licentious.

His standing force after the conclusion of the war did not exceed 20,000 infantry and cavalry. The militia, or national guards, were numerous, every man from the age of sixteen to fifty was obliged to assemble four times a year, and undergo a regular training. His troops were active, well-disciplined and armed, but wretchedly clothed. The fortifications he endeavoured to put in a state of defence ; fearing at all times that the French should again invade the island.

It is uncertain whether Dessalines, impressed by a conviction of his enormities, had endeavoured to reform his conduct, or whether he attempted to administer with moderation, from policy. But he was not trusted by the people, who secretly detested him as a tyrant. They at last determined, aided by his troops, to conspire against him, and near the north gate of the city of Port-au-Prince, he was shot on the 17th of October, 1806, by one of his own soldiers, a mulatto youth, about fifteen years of age.

Dessalines was born and worked as a slave. His father belonged to a carpenter, or *shingler*, the latter much the same as a slater. He was short, very stoutly made, and capable of undergoing extraordinary fatigue. He could neither read nor write. He merely signed his name. His military talents displayed daring movements, rather than well-planned operations. His activity was surprising, and the celerity with which he moved from one point of his command to another, both alarmed and astonished his enemies. He was vain, capricious, and fond of flattery ; still he was an extraordinary man, and would, if differently instructed and disciplined, have not practised atrocities, which were not only tyrannical, but, even in Hayti, utterly impolitic with regard to his own power.

In the time of Dessalines, there was no competition for the chief command : from the terror of his name, none daring to oppose him ; but after his death, civil war broke forth.

CHAPTER VI.

REIGN OF CHRISTOPHE AND PETION.

CHRISTOPHE was next in command to Dessalines, and on the death of Dessalines he assumed the supreme command in Hayti. He stood very high in the estimation of the people; and his bravery, humanity, and moral character, diffused an approval of his elevation. His bravery was indisputable.

Christophe at once evinced both sound judgment and good sense, and brought into his counsels the best men, both black and coloured, with great impartiality; he only objected to French whites.

Christophe assumed only the simple designation of "Chief of the Government of Hayti," under which, and not an imperial title and dignity, he determined to govern. He immediately endeavoured to establish a commercial understanding with Great Britain and the United States, to which purport he expressed his anxious wish to the officers of the British men-of-war, who frequented the port of the Cape, and to whom he always extended the greatest courtesy. To the Americans, who resided at the Cape for the purpose of carrying on commercial dealings, he also communicated his views on trade. The latter immediately transmitted his communication to their government, but the proposition, made to the British, received no encouragement. British colonial interests prevented a commercial treaty with Christophe. The rejection of his offer was a flagrant blunder, both in regard to British trade, and to the countenance which England should have extended to Christophe. He, meantime, directed his attention to other important measures for the improvement of his country.

His first address, dated the 24th of October, 1806, declared the commercial system which he intended to establish. *It proclaimed certain free ports, and that the flag of all nations would be respected, and property protected*; that personal security was pledged; and that the odious law, passed by Dessalines, which established exclusive consignments to the citizens of the country, was abrogated; and that every individual should have the right to place his property in the hands of his own agent, who should have the full protection of government.

Americans and Europeans soon found advantages in trading with Hayti. The manufactures of England, and the provisions of the United States, flowed into its ports. The people were not able to purchase the rich manufactures of Europe; they bought those which their means enabled them to purchase, buying on credit was not resorted to; it was a barter trade with foreigners; there was then little, if any risk, in the commerce with Hayti.

A competitor with Christophe for the supreme authority arose in the person

of Alexandre Petion, a mulatto, who had succeeded to the command held by Clerveaux, after the death of that general, and subsequently became commander-in-chief at Port-au-Prince. Petion was greatly respected by the people. He was in manners mild and attractive, and possessed talents of a very superior order. He had been educated in France, and served in the French armies, in which he had held the rank of a field officer. As scientific engineer, he had rendered essential services to Toussaint and Dessalines, who rapidly advanced him in military rank.

The competitors had recourse to arms. Christophe secured the whole of the north; on making an attempt on Port-au-Prince, he was repelled, and returned to Cape François.

In the February following, he published his new constitution, in which the Catholic religion is declared to be the religion of the state, and every other religion tolerated, and he declared "that the government solemnly guarantees the foreign merchants the security of their persons and properties." He also contemplated the establishment of public schools, as soon as the state of the country should be sufficiently recovered to enable him to carry his intentions into effect. He subsequently, on the subject of agriculture, expressed an anxiety, beyond ordinary solicitude, for that great source of wealth. He exhorted the people to an unceasing application to the culture of the lands, by the produce of which, foreigners would be attracted to their ports, to exchange the produce of their own countries, as well as money. Being uninformed as to the policy which foreign countries might adopt towards him, his wish was to remain quiet, until they decided, hoping that it might be such, as would be favourable to their commerce, and tend to bind an intercourse founded on common interests.

The declaration often made by Christophe, that he never would allow any interference on the part of Hayti with the colonies of any European state, was not believed to be sincere; until it was discovered that some persons in the southern parts of the island were intriguing with others in Jamaica, who were hostile to their government. He immediately arrested those in Hayti, and had them tried and punished for infringing his declaration. The British government, in consequence of his integrity, permitted an intercourse with certain ports in Hayti, by an order in council dated February, 1807.

In the year 1811, Christophe was elected to the throne, under the title of King Henry; which seems to have been approved of by the majority, if not of the whole of his subjects. It was believed by them that a monarchy suited the exigencies of the times, as more likely to make them respected abroad and maintain their peace at home. It was also an act of gratitude to one who had through a long career of war and desolation, rendered such important services to them.

At the time when Christophe became king of the northern part of Hayti a

cessation of hostilities was agreed to between him and his competitor: through, it was generally believed, the intercession of the British government.

Hostilities having been suspended, both rulers turned their attention to, peaceful industry, and chiefly agriculture and commerce. They adopted opposite courses. One adopted a system of rigid enforcement. The other submitted to the indolent habits of his people.

Christophe knew well the real character and disposition of his countrymen; and that to govern them, strong and powerful, yet just, measures were demanded. He, like Toussaint, knew also that if he were to relax authority, and permit them to follow their natural disposition, indolence would become general. Mr. Franklin, in his work on Hayti, observes of Christophe's rural policy, that—

“He was persuaded that, before it would be possible to raise his country in wealth and in happiness, an implicit obedience to such regulations as he should deem advisable must be enforced; that if the people were left to their own free agency, from their innate love of indolence, nothing could be obtained from them: they would wander about quite unconcerned for to-morrow, satisfied with that which the day had produced. He knew that the negro race were prone to idleness, and addicted to lust and sensuality; that they were ignorant of the duties of civilised life, and of the ties which bound them together; and it was a matter of the first importance for the consideration of those who were to direct the affairs of state, to devise the means by which they should be taught their duty to their country; that idleness and concupiscence were vices of the worst cast; and that unless an upright and moral course were pursued, they could neither expect improvement in their individual condition, nor advance themselves in the opinions of mankind.”

With these impressions, Christophe and his council, and other advisers set about a work, which, however imperfect they may be considered as legislators, exhibits no little share of talent and judgment. His “Code Henri” appeared in 1812. Franklin says,

“It is a digest of the laws passed for the government of the kingdom, and seems to have provided for every class of offences. Some of its laws are new, and others are founded upon the laws of his predecessors, with such judicious curtailments or additions as circumstances seemed to require. Those of agriculture and commerce are decidedly such as were in force in the time of Toussaint and Dessalines; and as they were effectual, and tended highly to augment those sources of national wealth, it displayed great discernment and discretion in Christophe to adopt them as part of his code. With this shield for the executive administration of the government, Christophe began to exact a due observance of all those measures likely to be beneficial to his country. He enforced attention to agriculture, encouraged commerce with foreigners, whom he led to his ports by extensive purchases of their commodities to supply the wants of his government, and he made rapid strides towards the advancement of education by establishing schools for the instruction of youth, and by inviting men of learning and talents from all countries, for the purpose of presiding at the head of the institutions which he had formed for the promotion of science.

“It has been often asserted that the negroes are as capable of receiving instruction in morality, religion, and every branch of science, as the people of any other nation or colour. This I shall not attempt to deny; but it may not be improper to say, that very few instances have yet been adduced to support such a theory, and that Hayti is an illustration of the contrary being the fact; for with all the advantages, with all the opportunities which Christophe afforded his people to improve their minds, and to seek

for knowledge in the various branches of science, very few indeed have been found who have raised themselves above mediocrity, whilst thousands have been found incapable of tuition, or have rejected instruction altogether.

"Mazeres, in speaking of them, says, 'The negro is only a grown child, shallow, light, fickle, thoughtless, neither keenly sensible of joy, nor of sorrow, improvident, without resources, in his spirits or his soul. Careless, like other sluggards; rest, singing, his women, and his dress form the contracted limits of his taste. I say nothing of his affections, for affections, properly so called, are too strong for a soul so soft, so inactive as his.'"^{*}

Christophe was induced also to improve the aspect of the country, by divesting it of the dilapidation effected during the war; and by commanding the nobility, and those attached to the government, to erect large houses on their estates, and to ornament the plantations in the vicinity of their residences; but he did not succeed, except in a few instances, the poverty of the men raised to dignities, made it impossible for them to comply with his commands.

After the fall of Napoleon in 1814, the ministers of Louis XVIII. sent commissioners to Hayti to try by a negotiation, or by menace, to bring under France the sovereignty of the island. De Medina, the commissioner deputed to Christophe, had served in the army of Toussaint, and afterwards betrayed his cause and joined Le Clerc. He was an object of suspicion to Christophe, and from some irregularity, respecting his credentials, he was arrested and seized. On the examination of his papers, it was discovered that his object was to excite insurrection among the people, and endeavour to prevail upon them to recognise Louis XVIII. as their sovereign: that monarch assuring them of paternal solicitude, and his pledge that they should retain their property and military rank.

Medina was tried and found guilty by a military tribunal of the charges. He was committed to the prison of the Cape, and it was supposed died there; but no accounts were ever obtained respecting him.

Monsieur Lavaysse, a man of ability, seems to have been the chief commissioner. He proceeded to Port-au-Prince for the purpose of carrying on a negotiation with Petion, and met with no better success,—except that having been more cautious he avoided the fate of Medina. Petion was well informed of the nature of the mission, and was prepared to give a decided negative to the propositions of the French crown.

Christophe was undoubtedly far better adapted than Petion to govern the Haytians. Of a resolute temper, and not dreading the consequences of his measures, however oppressive, and aided by men of ability, he enforced a rigid system of government, and exacted from the people an entire submission to his will. In consequence, the division over which he reigned, presented an aspect of prosperity quite different from that of the south. Agriculture was far better,

^{*} Letter to Sismonde.

attended to, the produce of the soil increased rapidly, and trade made some progress. Both contributed to the revenue, which in a short time amounted to the expenditure, and the people felt little oppression from taxation.

Petion adopted a system of relaxation, which involved the greatest fiscal difficulties, and all the evils inseparable from an indolent and poor population. The people, allowed to follow their idle inclinations, indulged in the propensities of the negro race; and to prosecute measures for the advancement of the wealth and prosperity of the country, soon became impracticable. Agriculture was neglected, cultivators relapsed into idle, vicious, and unclean habits. Vice prevailed, and the cultivation of the soil was entirely neglected; except so far as mere subsistence rendered necessary.

Petion never seems to have insisted upon the due execution of the rural laws; and his people, and their lands, exhibited wretchedness and poverty, in consequence of his wanting the resolution and decision which distinguished the administration of Christophe. The mild character of Petion disqualified him from ruling over a rude and untaught people. He was indulgent, irresolute, and humane; while Christophe was resolute, decided, and unrelenting in his system of government. Walton says Petion was,

“Of a sensible and humane character; tutored in the schools of Europe, his mind has received an expansion that fits him for the helm of government, and his exterior an address that would distinguish him in a court. Ill-suited, perhaps, to witness scenes to which his station as a military commander exposed him in the field of battle, the tear of sensibility often bedews his cheek at the sight of slaughter, and though brave, enterprising, and bold, he values more the responsive glow of a humane act, than the crimsoned laurel he has plucked from the brow of his adversary. He sighs at the purchase of victory with the sacrifice of those subjects whom he loves; in short, nothing can be more descriptive of his peculiar virtues, than the motto of an English artist, at the foot of his portrait — ‘Il n’a jamais fait couler les larmes de personne.’”*

Petion soon became involved in fiscal poverty. A fictitious or debased currency was suggested and adopted as an expedient: that is to say, swindling the people under the sanction of government. It is true that Europe afforded a precedent to the educated Petion: that France, Austria, and some other European states had cheated the people by debasing the currency. Petion could not borrow money, even upon the security of the public lands, to meet the ordinary expenses of government. It was impossible that fictitious coin would ever be called in, unless at a ruinous depreciation. He first issued four millions of dollars consisting of about nineteen parts of tin and one part silver. This temporary relief enabled him to carry on the government for a short time without any calls on the people. No measure could have been more unwise. It caused them to become even more improvident than they had previously been; and the foreign merchants whom he had induced to settle in his dominions, lost all confidence in the stability of the government, their importations gradually fell off, and the customs' revenue fell infinitely short of the previous receipts.

* Walton, vol. i.

For the encouragement of agriculture, instead of enforcing the rural laws of compulsory cultivation for the benefit of the cultivator, the government, whenever the price of products were low, bought largely, in order to raise the price. This most fallacious and impolitic measure was not only pernicious as a burden on the treasury, but it drove foreign purchasers out of the market.

Christophe compelled the magistrates to see the rural code rigidly executed, and accompanied by his staff, he rode personally to different parts to ascertain the state of agriculture. He thoroughly comprehended, that to give way to the disposition of the people, would render them irrevocably lazy and vicious. His country in consequence advanced in wealth and in orderly government, the cultivators of the soil, instead of living in idleness, disease, and misery, were industrious, fared well, and lived in comparative morality and contentment. The cultivators of the soil under Petion's mild administration presented a most instructive and lamentable contrast. Indolent, improvident, thoughtless of the future, consuming what the hour afforded them, they passed their time. They lived like some animals, in apathy and indifference. Depravity of all shades, and especially the great passion of their sensual appetites, pervaded the whole people. Disease also, accompanied by poverty, soon rendered them a most wretched race.

For some time before the death of Petion, which took place on the 29th of March, 1818, he named Boyer for his successor, and he was immediately declared president.

Christophe did not interfere with the election of Boyer. The former had accumulated a very large surplus in his treasury, with which he intended to purchase the Spanish territory, and to annex it to his dominions, but his death in October, 1820, put an end to the negotiation which he had opened; an union between the north and south parts was then effected under one government, designated "The Republic of Hayti."

His resolute system was no doubt despotic; his ambition was great, and his absolutism was so severe, that it caused a revolt of the garrison of St. Marc, and invited Boyer to assume the government. The city of Cape Haytian followed the example, and the troops prepared to march against Christophe, who was confined by sickness at his palace of Sans Souci. His guards revolted, and finding escape impossible, he shot himself. His sons and several of his officers of state were murdered by the troops. His eldest son begged them to save his life; but the youngest bravely defended himself, and killing several of the soldiers, he was, however, cut down and shockingly mangled.

His wife and daughters were spared by Boyer, who sent them to Port-au-Prince by sea, and he afterwards permitted them to leave the country. They then sailed for England, where they were received with some attention. A small estate

was secured for, and her valuable jewels were restored to, Madame Christophe. She was a good humane person, who often subdued her husband's severities in the infliction of punishment. Christophe is now, however, considered, notwithstanding his absolute spirit and character, as the only man that has appeared in Hayti competent to rule over a people so ignorant and unprepared for liberty. It is believed, that if Christophe had lived he would have elevated Hayti in affluence and in civilisation. Since his death, the former has diminished, and the latter has not advanced.

CHAPTER VII.

REIGN OF PRESIDENT BOYER.

JEAN PIERRE BOYER, a mulatto, was born at Port-au-Prince. His father, who possessed some wealth, was a store-keeper and a tailor in that city. His mother was a negress of the Congo country in Africa, and had been a slave. He joined the cause of the commissioners, Santhonax and Polverel, with whom he retired, after the arrival of the English. He accompanied General Rigaud to France, after the submission of the south to Toussaint. On the voyage he was captured by the Americans, during the short dispute between France and the United States. Having resided in France some time, he attached himself to the expedition of Le Clerc, for the subjugation of the colony. On the death of Le Clerc he joined Petion, who appointed him, one after the other, his aide-de-camp, private secretary, chief of his staff, general of the arrondissement of Port-au-Prince, and finally his successor.

Boyer, on his succeeding to the government, was in appearance below the middle size, very slender, with an unengaging countenance, but a quick, penetrating eye. His constitution was weak, and afflicted with an organic disease, relieved only by temperance in living. Parade and show, which became a custom, he seemed personally to have no propensity for, but he compelled his staff and household to appear in all their glittering embellishments. He appeared seldom among the people except on a Sunday, when he came forth at the head of his troops, and after reviewing them, he rode through the city, attended by his staff and guards. He was vain of his person, and fancied himself and his manners irresistibly attractive.

On the 21st of October, 1820, Boyer entered Gonaives without any opposition ;

on the 22nd he marched to Cape Haytian, the capital of Christophe, which he entered the same night at the head of 20,000 men, and on the 26th he was proclaimed president of the north, with the salutations of "Long live the Republic of Hayti!" "Independence, Liberty, and Equality!" and "President Boyer!"

The revolution in the north, was followed by that in the eastern, or Spanish part, at the end of the succeeding year, in the city of St. Domingo. A deputation of the principal inhabitants waited on President Boyer at Port-au-Prince, and tendered submission of the east to the republic, soliciting that it might be incorporated with the republic of Hayti.

In the Spanish part there were a great many Haytian refugees, who had made some progress in their plantations, and with the people of colour formed the largest proportion of the inhabitants. On the arrival of Boyer, in the city of St. Domingo, the people received him, it is said, unanimously. Arrangements for the future government of the east were made, and General Borjellas was left in command of the city.

By the annexation of the Spanish part, and that without bloodshed, the whole island came under one government, and Boyer had no competitor to oppose him.

Boyer attempted little, that was really efficient, for bringing forth the public resources of the country; he seemed insensible to the advantages to be derived from agriculture; the people soon became indolent and obstinate. Commerce declined and almost vanished. The soil produced little for market. Finding his financial wants increasing, he issued debased coin.

The most senseless unwise scheme which Boyer effected, that which now so greatly oppresses Hayti, and which led in a great measure to the last revolution, was his sending, in May, 1824, two agents, Rouanne and La Rose, senators, to Paris, to negotiate for the recognition of the independence of their country, avowedly admitting by it, that France still held the sovereignty over it. These agents were authorised to offer 100,000,000 francs, with certain privileges of trade to France; but the offer was rejected, and the agents ordered to quit the country without delay. The Haytians, in fact, entrapped their independence; and when it was known in France, that Boyer had granted an English company the privilege of working mines in the eastern part of Hayti, a fleet of fourteen ships of the line sailed under Admirals Jarien and Grivel, for reducing the Haytians to acknowledge the King of France as sovereign over them, or to submit to such terms as should be tendered.

To Baron Mackau was confided the negotiation on the part of France.

On his arrival at Port-au-Prince, the admirals moored their ships abreast of the city. From the wretched condition of the batteries and forts, one line-of-battle ship could have demolished the whole.

Two officers of the president's staff, were sent on board the ship of the commander-in-chief, to ascertain the object of the expedition, and they returned to the president, with communications from Baron Mackau, explaining the nature of his mission, assuring him that it was entirely pacific; and on the part of the King of France, meeting in accordance the overtures which Boyer had previously made by his own agents.

The next day Baron Mackau landed under a salute from the forts, and proceeded to the government-house, where he was received by the president, surrounded by the officers of state and his staff.

The details of this negotiation would be uninteresting. It ended by an acquiescence on the part of Boyer to an ordonnance, dated Paris, the 17th of April, 1825, and signed by the king. It stipulates that the ports in the *French part of St. Domingo* shall be open to the commerce of all nations; that French ships and merchandise shall be admitted into the *French part*, on paying only half the duties exacted from other nations, and the same on the exports thence; that the *inhabitants of the French part of St. Domingo* agree to pay, in five annual instalments, the sum of *one hundred and fifty millions of francs* as an indemnity for the losses of the ancient colonists; and that when the conditions of this ordonnance are fulfilled, the *French part of St. Domingo is declared independent*.

Fêtes were given in Port-au-Prince to Baron Mackau, and the French officers were continually beset by persons paid by the president to cry in the streets, "Vive Charles the Xth!" "Vive le Dauphin de France!" "Vive la France!" "Vive Haïti!" "Vive le President d'Haïti!" "Vive l'Independence!"

The negotiation for independence having been arranged, it was considered necessary that commissioners should be sent to France for the final adjustment of some differences which could not be provided for in the preliminary treaty, and for the raising of money, by a loan, for the payment of the first instalment of the indemnity.

They failed in their mission; and the cabinet of France tendered to them the basis of a definitive treaty comprising twenty-one articles, with which they were ordered to return to Hayti, and to lay it before their government for approval, or rejection. Boyer was anxious to accept it, but his council and the secretary-general, Inginac, opposed it. Boyer, much against his inclination, rejected the treaty, but intimated to the French cabinet his wish that a treaty, reciprocally advantageous, should be contracted, and establish a good understanding between the two countries. He further pledged himself to conform to the admission of the ships of France, on paying only half duties, and for the payment of the indemnity as the instalments became due.

The British government having decided on sending a consul-general to Hayti, Mr. Franklin, who was the bearer of the communication, says,

“ Boyer's officers of state and the people in general manifested the greatest solicitude for his appearance ; a solicitude, emanating from a great sense of the importance which they attached to it. The president suppressed his feelings, whatever they might have been ; but at times he could not resist the temptation of condemning the delay which intervened between the appointment of the consul and his departure from England ; and he was often heard to say, that he questioned the sincerity of the British cabinet respecting such intentions, and that he believed it to be only a *ruse de commerce*. The inhabitants, however, were of a different opinion ; they knew the integrity of the British government, and were confident that its commerce would not be neglected, but promoted and extended, wherever it could be accomplished.

“ On the 25th of May, the consul-general and his suite arrived in his majesty's ship *Druid*, Captain Chambers ; but as she did not appear off the harbour till nearly dark, she was not recognised by the government officers, and consequently did not salute before the following morning, when it was returned by the forts, which was the only demonstration of respect offered by the Haytian authorities on his arrival. Nay, President Boyer could not conceal his antipathy, nor restrain his dislike to the English, even though he perceived that the presence of the British mission had a strong tendency to reconcile all classes of his citizens to his impolitic measures. He individually neglected even to congratulate the consul on his arrival ; he did not pay him the common civility of sending one of his aides-de-camp to express himself friendly to the object of his visit, as was the case on the arrival of the French consul-general, to whom he sent two of his staff to offer him the assurances of his high consideration and esteem. The consul-general of England was only visited by a subaltern of artillery on the staff of General Inginac, and the general was absolutely precluded paying a higher compliment to him by the positive orders of Boyer.”

The only department of government to which Boyer seemed to devote his attention, was the military establishment. He fixed it at 45,000 men, besides the national guards, 113,000, who were armed and disciplined.

The reign of Boyer was of a long duration ; yet he did not enjoy that career, without attempts to dethrone him. Boyer was no doubt a man of great personal energy, and powers far above the ordinary standard were requisite to have maintained authority over, not only the former French part, but even the Spanish division, for twenty-four years. That he was a *despot*, there is no evidence to dispute ; but we believe that none but a despot, little under that of a dictator, could have ruled for nearly a quarter of a century over such a people, as constituted the whole heterogeneous population of Hayti. He is accused, by his opponents, of having almost destroyed the legislative representation, by the limitations introduced by him in 1822, 1832, 1839, and 1842, and by thoroughly destroying, by corruption, its independence ; of filling the senate with members either of his own relations, or those whom he could influence or corrupt ; of assuming powers not authorised by the constitution, especially that of coining money, debasing the currency, and of pardoning criminals ; of suspending the civil laws ; of an unconstitutional organising of the army, in order to maintain his absolutism ; of replacing the municipal authority, by establishing, under the pretence of maintaining public order, special commissions in the towns and villages ; of taking the initiative, in imposing customs' duties, charges, and taxes ; of *altering* the text of the laws, and refusing to promulgate those framed by the legislative

assembly; of depriving citizens from being tried by the civil judges, and having them convicted by courts' martial; of removing honest judges, and replacing them by his own creatures; and of various other treasonable acts.

There may be exaggeration in the foregoing accusations, as to the extent which the *mal*-administration and despotism of Boyer have been exercised; but their general truth is undeniable. Yet, in the year 1842, the stability of the authority of Boyer, and the fidelity of the army, was not doubted. Both were, however, for a considerable time undermined; and, it required but a few daring minds, to cause a general explosion of the power of the despot, and the loyalty of his officers and military forces. There is scarcely a revolution in the history of nations, that has not been preceded by fiscal perplexities, and by public distress. It is the greatest test of wisdom, forecast, and sound judgment, in the ruler, or the statesman, to provide against the calamities of the treasury, and the hunger of the people.

The fiscal perplexities of Boyer, and distress among the inhabitants, were not altogether caused by his own acts; but, in a great degree, they were the natural effects of his measures. The payment of the annual instalments to France, for an indemnity, that was neither morally nor legally due by the citizens of Hayti, and for the voluntary recognition of which, Boyer was guilty, probably with a view to strengthen his own power; and the maintenance of a large army, as well as the corruption of public men, required excessive taxation, and drained the treasury. The people were in consequence compelled to provide for the public burdens. It is true, that the taxes, which were imposed, might have been endured by a population of ordinary industry, but which certainly did not characterise the inhabitants of Hayti. The disastrous earthquake of 1842 was succeeded by an accidental calamity, or, as many believe, an act of conspiracy, which inflicted great distress on a large community. Both led to the development of the pre-existing elements of outbreak, and to a successful revolution.

On the 9th of January, 1843, a fire broke out in Port-au-Prince, and destroyed one-third of the city, including nearly all its wealthy and most populous streets. About 400 houses were utterly destroyed, and the loss of property was enormous. Many of the sufferers owed large sums to foreign merchants; especially to houses in Glasgow and Dundee. The destruction of property, and the consequent poverty, excited exasperation on the part of the rabble, who afterwards attempted several times to fire the remaining part of the city. A few days after, the conduct of the government, respecting an indemnity paid for the illegal detention of a Spanish vessel, created very general disapprobation; and a conspiracy for the overthrow of Boyer was discovered. Its head-quarters were at Aux Cayes, and it extended to Jeremie, Anse de Veau, and other places.

The President, who had often been successful in suppressing conspiracies and revolts by military force—not without severity, considered that the revolt at

Aux Cayes could be without difficulty crushed. But he was undeceived when he learned that General Hérard Rivière, a mulatto, of great energy and boldness, had, on the 28th of January, revolted with two regiments of the line. Hérard marched, first to summon the surrender of Aux Cayes,—but did not attack that city. He then marched to the city of Jeremie, which received him with his troops, and the other insurgents. Here the rebel general established his head-quarters. President Boyer certainly displayed his usual energy, on this formidable revolt; and he first concentrated and then marched three military divisions, under Generals Inginac, Suffren, and Richet, against the insurgents—with a force far more than sufficient to defeat and suppress them. Boyer himself remained in the command of the capital. His measures were ably conceived, decisive, severe, and certainly unscrupulous. He arrested and imprisoned all in the capital whom he considered dangerous; meetings of more than five persons were proclaimed illegal; all letters were opened, and if the fidelity, which he expected from the army had existed, he need not, at least, on this occasion, have feared the deep-rooted disfavour of the people. History, however, proves, that when a whole people are prepared to revolt against their oppressors, the latter can place little confidence in their armies. The bravery of the French army was never questioned; yet that army will ever be found to fight, not for the sovereign alone, but, instinctively, and intelligibly, for the nation, and with the national guards. If this were not true, Louis XVI. would never have been guillotined, and Charles X. would have died King of France.

On the 26th day of February, news arrived at Port-au-Prince, that two actions had taken place between the president's troops and the revolutionary forces,—that the former were in both defeated,—and that the president's soldiers were hourly deserting to the standard of General Hérard. Boyer instantly ordered nearly all the troops in Port-au-Prince to march against the insurgent general. The president, meantime, was actively employed in placing the capital in a state of defence, until he learnt that the national guards, whom he had sent forth against, had joined, Hérard,—that the desertions to the latter were increasing,—that fresh disasters were experienced,—that Generals Borgello and Richet, with the chief division of the army, in garrison at Aux Cayes, and on which Boyer chiefly relied, had surrendered to Hérard,—and, that the surrender of Jacmel immediately followed. On Sunday, the 12th of March, General Miraud, with an army of six thousand of the president's choicest troops and national guards, was ordered by Boyer to attack the advanced post of the revolutionists at Leogane. The action lasted only about ten minutes,—the national guards marched over to the insurgents, followed by three or four regiments of the line; and the remaining débris of this force, the last hope of Boyer, retreated in confusion to Port-au-Prince.

Three of her Britannic majesty's ships of war were then in the harbour; and President Boyer, seeing his case desperate, applied to her majesty's consul for a

retreat on board one of these ships, which request was immediately granted. Boyer, with great dignity, then formally signed his abdication: stating, his only object was to save the effusion of blood at Port-au-Prince; and then, not without risk from being taken by the insurgents, he embarked on board her Britannic majesty's ship *Psyche*, and soon after sailed for Jamaica. The French consul had also placed a French ship of war at the disposal of Boyer; and it is rather surprising that he refused the offer, as he had always been accused of a feeling in favour of France. General Inginac, on the other hand, who had been charged with too great a partiality for the English, embarked on board the French corvette.

CHAPTER VIII.

ADMINISTRATIONS OF PRESIDENTS HÉRARD, GUERRIER, PIERROT, AND RICHÉ.

ON the 21st of March, General Hérard Rivière entered Port-au-Prince, at the head of 10,000 troops. He was enthusiastically received, and hailed as the liberator and regenerator of the country. A manifesto was published, detailing the degraded state into which the country had been reduced by President Boyer; and a decree deposing him, and enumerating all his treasons, was printed and promulgated. Various acts of government were then administered by the provisional government in the name of Hérard, as "*Chief executor of the will of the sovereign people*," but in reality as military dictator.

Hérard was compelled to march to the Spanish part of Hayti, and reached the city of St. Domingo, in July. At Jeremie, and other places, dissatisfaction arose among the blacks. At Aux Cayes an insurrection broke out, which nearly brought about a fearful collision of classes—the blacks, who are far the most numerous, against the coloured people. General Hérard, then at St. Domingo, immediately sent off one of his staff, and ordered the leaders of the blacks to be arrested: 500 to 600 blacks, led by a negro of the name of Salomon, rose in arms against Hérard's national guards. The black insurgents were, however, about the 15th of August, dispersed by General Lazare, and Salomon was taken prisoner. A similar revolt, headed by a black general named Dalzon, was attempted at Port-au-Prince, Dalzon was arrested, and shot. Other attempts, on the part of the blacks, were suppressed by Hérard, and martial law was proclaimed on the 12th of September. Meantime, it was considered the best remedy against revolts to elect a black president; but General Hérard's claims were not so easily overcome. Other competitors came forward—among which was General Lazare, a negro of about sixty years of age, but ignorant, avaricious, and rapacious. It appeared that the

attempted revolt under Dalzon was connected with a plot, on the part of the blacks, to massacre every coloured man, woman, and child; and that Dalzon had decreed, that every black who should protect any mulatto, would be punished by the tearing out of his eyes and tongue.

The constitutional assembly met in the end of September. The first act of the members was to vote themselves salaries. They then changed the name of Port-au-Prince to that of Port Republican. On the 17th of December, General Hérard accused the constitutional assembly of causing delay in framing a constitution, and the formation of government. He addressed his army, charging the assembly with conspiring against the country, and that unless they gave a constitution by the 20th, he would resign, and retire into private life. The troops immediately saluted him, by *vivas*, as President Hérard Rivière. This was, on the part of Hérard, a mere *coup d'état*; and on the 30th of December, the new constitution was promulgated, and General Charles Hérard Rivière, unanimously, and enthusiastically, elected President of the Republic.

On the 27th of January, 1844, the anniversary of "the revolution of regeneration of 1843" (such was its designation), was celebrated by court ceremonies, *fêtes*, speeches, *vivas* for Hérard, military reviews and spectacles, in imitation of the *fêtes* of July, in Paris.

On the 1st of February, the *Progress*, a journal published at Port Republic, exulted in the happy state of liberty then enjoyed by the citizens of Hayti. "Forty years ago," says this paper, "Dessalines relieved the African race from the ignominious European yoke, under which they groaned for ages. Let us shout, 'Live free, or die' (*Vivre libre, ou mourir*). We are delivered from the ignoble and degraded rule, under Boyer, from 1820 to 1843, by the moral revolution of the latter year." (*Revolution toute morale de 1843.*)

Hérard was unfortunate in the appointments he made of the chief officers of state, especially that of his foreign minister, Dumésle. The latter was the main director of the revolt against Boyer. He was, however, unfitted for business, by the leading infirmity of the inhabitants, idleness. He was plausible, that is, he was a *faisseur de phrases*. The military opposed the new constitution, which was prepared in imitation of the French charter of 1830, and discords between President Hérard and the legislative assembly soon broke forth. Three regiments, under a General Thomas, in the north, protested against the new municipal system, and against *préfets* of departments. Bazin, a black deputy, left the chambers, proceeded to the north, and raised the blacks, ostensibly against General Thomas, but in reality against President Hérard. In an affray with the troops, near St. Marc's, Bazin, with several of his adherents, were shot and cut to pieces. In the capital, with its new name, Port Republican, violence was manifested between president Hérard and the legislative chamber, and he called on the army and the people to decide between the "Hundred Bazins

sitting in the legislative chamber and himself." Meantime, symptoms of the revolt of the Spanish part of Hayti required the immediate energetic action of a bold and able ruler to suppress the insurgents, and to bring the whole island under administrative obedience. As far back as July, 1843, a landowner of San Domingo, named Piméntal, was authorised to state to the British consul, at Port-au-Prince, that the people of the Spanish part, were determined to declare themselves independent of the French part of the island, and that they wished to place themselves under the protection of Great Britain. The offer was very wisely discountenanced by the British consul. Piméntal headed the revolt in San Domingo, in the end of February, 1844, against which President Hérard marched with his whole force. Before he arrived, the Haytian authorities, in the city of San Domingo, were overpowered and imprisoned. Almost simultaneously, Azua, Neivae, St. Jean, L'Escuobas, St. Jago, and Porto Plata, rose in arms against the Haytians. In the end of March, at Azua, 200 to 300 of his troops were killed or wounded. His army in the north was also defeated. Aux Cayes was taken,—Jeremie surrendered to the revolters on the 12th of April,—and on the 3rd of May, the old negro, General Guerrier, was proclaimed president. Hérard gave in his adhesion, the campaign ended, the army retired, and was in part disbanded.

Hérard and Dumésle were banished ; but they previously asked the British consul for an asylum on board a British ship of war, which carried them to Jamaica.

Hérard was a brave soldier ; but unfitted for the post of president. He hated the democracy and the legislative assembly. The new constitution, divided Hayti into the six departments of the *South, West, Artiboniti, North, Cibao, and Ozama* ; these were again divided into arrondissements, and subdivided into communes. Both the constitution, and the divisions, of the country were in imitation of both in France. The great majority of the military officers, and no doubt Hérard, were opposed to the constitution. On its being read, in the presence of the people and the army, the officers came forward in a body, crying loudly, "*A bas la constitution, à bas les préfets ;*" at the same time the democratic party made great efforts to substitute a civil for the military government, which had ruled under Boyer for nearly twenty-five years. The political prisoners were liberated by a decree ; another decree removed the prohibition of intercourse between Hayti and Jamaica, and the other British possessions. Equal rights were declared to all Haytians, born in Hayti ; if descended from Africans, or Indians. The animosity between the blacks and coloured races was still manifested ; and this mutual hatred was not extinguished, even by the election of a negro president, in the person of old General Guerrier.

On the 10th of June, 1844, revolts had been so far successful, that the

whole island of Hayti was under four separate authorities or governments. The Haytians were expelled from the Spanish, part by young, and by almost beardless men. On the 12th of July, Santa Anna, the San Domingo general, who had commanded at Azua, entered the city of San Domingo, and was proclaimed supreme chief. Previously to the revolution, he had lived as a private country landed proprietor. He then possessed considerable landed property, most of which he spent in the service of the new republic. He is described as a man of good common sense, of moderate views, no lawyer, and not bred a soldier; yet on taking the command of the insurgent force, he displayed great ability. There is no doubt that Hèrard's conduct, on visiting the towns in the Spanish part, was in many respects arbitrary, and the deputies of the Spanish part were afterwards so greatly disappointed at Port-au-Prince, that on their return, they immediately resorted to arms for their independence: the rapid final defeat of the Haytians followed, with a loss, it is estimated, of nearly 2000, at an expense of 500,000 dollars, and the expulsion of Hèrard from the presidency.

The Spanish part had separated into two, one of which, the north end, under General Duarte, but the latter was soon subdued by Santa Anna, who united the Spanish part, which, it is asserted, now includes at least three-fourths of the whole area of the island. It is, however, the least cultivated: the blacks form but a small proportion of the inhabitants, and the people have lived chiefly on the products of their pastures, and on the sales of mahogany, dyewoods, and hides.

In April, 1845, while the Haytian north-western part of the island was subsiding into some tranquillity, reports arrived from Jamaica, that preparations were making by the ex-president, Hèrard Rivière, to recover the reins of government. This intelligence created great anxiety amongst the mercantile classes. A few days after, the sudden death of President Guerrier seemed the signal for new troubles, if Hèrard should succeed in landing; but the almost unanimous disposition of the inhabitants for peace, saved, for the time, the country from civil war. Pierrot was then seventy years old, and the debt to France, and the independence of the island, rendered his government feeble. Meantime, Hèrard Rivière sailed in a small vessel from Jamaica, and made an abortive attempt to land.

On the 8th of May, President Pierrot made his public entry into Port Republicain. He was received respectfully, but without enthusiasm. It was evident that he was destitute of energy and decision, and on his departure for Cape Haytian, his wavering conduct had alienated the confidence of the inhabitants. He left three of his ministers, in the capital, for administering the affairs of state, and in a few weeks it became evident that parties were only waiting the president's death to commence a civil war.

In addition to all other elements of disturbance, a scandalous waste in the expenditure of the public resources became the cause of great difficulty; the

army alone now costing an annual rate of 3,000,000 dollars, currency: being double the expenditure under the severe Boyer. This corruption and waste arose, in a great degree, from each candidate for the presidency being obliged to satisfy the numerous military and political officers. All the money in the treasury was May, 1845, now expended; paper money was issued, and bankruptcy seemed inevitable.

In September, a decree was promulgated, depriving Haytian citizens of their civil rights in certain cases. The pretence of issuing this decree was, that "several *illegitimate* children of Frenchmen, in Hayti, *obtained* from the French consul certificates of French citizenship."

An insurrectionary movement broke out during the month, in favour of Hérard Rivière, headed by General Pierre Paul: the insurgents were defeated by the government troops, and General Paul, and all the principal revolters, shot. Civil war, however, continued between the Haytians and Dominicans: the former were defeated by the latter, with considerable loss.

The ports of the eastern part of the island were declared by the Haytian government as blockaded. This was little more than a farce. The blockade never could be enforced, and only existed in the printed proclamation. The war between the East and West was continued during the rest of the year, with no decided success, and the Haytian part of the island was involved in all the evils of political and fiscal embarrassments. During the month of February, 1846, the reopening of the campaign against the Dominicans commenced. General dissatisfaction prevailed in the country; and a change of government became probable.

On the 1st of March, another revolution broke out, and General Riché, a negro, about sixty years old, was proclaimed president. He is said to be a man of energy, and he chose as his principal adviser, *General Dupuy*, a very intelligent man: who had been in London in 1843-4, with powers to contract a loan and negotiate. The new government issued an amnesty,—restored the constitution of 1816,—promulgated decrees for the encouragement and protection of commerce and agriculture. The whole Haytian country, except Cape Hayti, submitted to General Riché; and it was anticipated that from the moderation and wisdom, yet energy, of the new president, order would be completely re-established. After some resistance on the part of the ex-president Pierrot, the latter abdicated on the 24th of March. Excesses were, however, committed by the disbanded soldiery, and a disposition manifested in some parts to involve the country in fresh anarchy.

The new president visited several parts of the country, for the purpose of restoring order. The obstacles to the permanence of his government are the financial difficulties, and the disposition of the lower orders, for any change whatever, with the hope of plunder.

On the return of the president (Riché) from the southern parts of Hayti

tranquillity was restored in those districts ; and the whole of the western, or French part of the island was subjected to a state of comparative order. Guided by the advice of M. Dupuy,* the president reformed several local administrations, which were placed on a more economical footing than formerly. Important financial reforms were directed to be immediately executed. A law was passed by the Haytian legislature, reducing the salaries of all public functionaries, civil and military, including the president and his ministers, to one-half for six months. This measure, however necessary, is naturally very unpopular. It was impolitic as far as it extended to the great majority of employés, who never received but a bare maintenance, and have consequently been tempted to resort to dishonest practices ; one result of which has been, that smuggling has prevailed in all the ports of the republic : the high import duties offering a temptation, irresistible to low paid revenue officers.

It appears that there is no disposition on the part of the new president to conquer the eastern, or Dominican part of Hayti ; great wretchedness prevails in those districts, and the barbarous warfare long carried on has only resulted in aggravating misery and poverty on both sides.

The great expenditure of western Hayti is chiefly caused by maintaining the army : during the year 1845-1846, it absorbed, out of the general expenditure of 5,148,724 dollars, the sum of 3,786,329 dollars ; leaving only 1,362,395 dollars for all the other branches of the public service. There are in the Haytian part of the island more than 200 general officers, and about 3000 colonels and other superior officers, all receiving pay.

Agriculture has been so far neglected, and the products so badly prepared that Haytian coffee is in little repute in European markets, from the careless and slovenly way in which it is gathered ; good and bad berries are mixed up with stones and dirt, to add to the weight. When properly cleaned and separated, the coffee of Hayti has always been considered superior to any in the West Indies. This same negligence applies to Haytian cotton, cocoa, and logwood.

Owing to the extravagant expenditure of former governments, the value of paper-money and base coin in circulation amounted, in 1846, to about 8,000,000 of dollars currency ; the value of which dollar being depreciated to one-fourth of the Spanish dollar.

Attention was lately directed to a revision of that part of the constitution which forbids *white* men to hold property in Hayti. We are informed that the most enlightened Haytians are in favour of abolishing this restriction, as injurious to the interests of the country, and disgraceful to their laws ; but it might not be prudent in the government, although they are supposed to be

* We were in communication with General Dupuy, when he was in England ; we found him an able man, who perfectly understood the details and principles of trade. He was many years a partner in the principal British house in Hayti ; and we learn that he is now most desirous to give every encouragement to foreign commerce, but that he meets with much opposition, both in the senate, and also from the absurd prejudices of the great mass of the people. He appeared a much nearer approach in colour and features to the European than even to the Mulatto.

favourable to the naturalisation of foreigners, to offend the prejudiced masses, by creating an apprehension of foreign domination.

President Riché was formerly in favour of substituting a monarchy for the present republican form of government; but since his elevation to the presidency, he has not intimated any desire to realise this change. The present system, while the president rules, is fully as despotic as royalty could be. During the short period that Riché has held the despotic reins of state, he has done much towards clearing the capital of the assassins, thieves, and rabble that have so long infested it. He has also directed that the city shall be cleaned from the filth which pervades it, and that the streets and wharfs shall be repaired.

There are now (at the close of 1846) due three instalments of the indemnity to France amounting to about 4,500,000 francs: the Haytian government is quite unable to liquidate these arrears. Nevertheless, the president and his ministers take every occasion of declaring, both publicly and privately, their anxious desire to fulfil their engagements to France. The French consul-general has proposed that the Haytian government should apportion, annually, a part of the customs revenue towards payment of this indemnity, but it has not been deemed expedient to accede to this proposal. Whether President Riché, guided by the wisdom of General Dupuy, may be successful in extricating Hayti from its present difficulties, and to lay the foundation of future good government and prosperity, will depend very much on their acts; but we fear that more is dependent on the submission to order first, of the numerous military aspirants, and second, to a reform of the turbulent and yet lazy dispositions of the people.

From the day on which Christophe expired, down to the present day, a period of twenty-six years, neither industry, nor improvement, nor energetic administration, nor the extension of the education of the people, nor any progress in the march of civilisation, appears in the agricultural, manufacturing, commercial, moral, social, or political condition of the republic of Hayti. The climate, the soil, and the pastures, yield, almost without culture, sufficient merely to feed a people, too indolent to work for comforts and luxuries. The natural inclination of all mankind, in a rude state, is indolence, and an absence of forecast in providing for the future. But there are races, among which individuals arise with powers of mind, so far superior to that of the communities among which they have been born, that their perceptions have discovered means, for ameliorating the rude state of uninstructed man; and who have, by force of character and wisdom, directed some races, more rapidly than others, into that progress which has formed their advance, by degrees,—from the savage or rude state in which man has, first, subsisted, on the produce of hunting, fishing, and of wild herbs, roots and fruits,—to the pastoral and agricultural state; and, thence, always accompanied, more or less, by both the latter, into the discovery of the more simple arts,

manufactures, and sciences—to the pursuits of navigation, of trade—to learning, intelligence, and to the higher arts and sciences. Self-discipline, and virtue, must necessarily accompany and direct this progress, which is the result caused by the elements of commercial intercourse, of civilisation. Luxury and voluptuousness, arising from the accumulation of wealth, and, as under the Medici, the exercise of despotism,—and the absence of civil liberty and religious freedom, have no doubt pervaded, and in most cases prevailed during, periods of high civilisation. There is no greater fallacy than to confound civilisation with civil liberty. The age of the Medici, and the Borgias, and of Louis XIV., were brilliant epochs of civilisation, of arts, of learning and science: but neither civil liberty, nor religious freedom, existed during those periods in either Italy or France.

Among the rude inhabitants,—the swineherds, and hunters of the German forests, there was almost perfect civil liberty,—in the absence of arts and sciences, and nearly of trade, or manufactures, or any of the elements, which are considered as forming the great framework of civilisation.

Among the Hurons, Iroquois, and other barbarous nations of hunters in North America, there appeared, within each nation, perfect civil liberty.

In luxurious and civilised Mexico, the emperor was absolute, and not to be questioned in his rule: the priests were terrible in their religious domination, and in their sacrifices.

That social and political state of communities, in which the greatest happiness is attained, to which human nature is adapted, can only exist when the people are so thoroughly educated, and of such wise judgment, as to appreciate so thoroughly the blessings of civil liberty and religious freedom, that they, at the same time, make, or consent to, the regulations which restrain one man from perverting that liberty, to the injury of the property, or person, of another man:—that is freedom without anarchy, constituting wise, equal, just, mild, yet energetic government. Under such government, civilisation, in its highest degree, and true civil liberty, and religious freedom, are thoroughly compatible. But such intelligence and such government has never yet existed. The progress of education, the wonderful power of scientific invention, and that celerity and freedom of intercourse between the nations of the earth,—freedom of personal intercourse, and of the interchange of commodities, which navigation and the steam-engine have, during a late period of the world's history, rendered irresistible, will, no doubt, rapidly advance nations towards that state of civilisation and intelligence, and, that civil and religious liberty, which can exist practically and happily together.

But, that there are races and nations, which do not move onward in this progress as rapidly, or as securely, as other races do, is a mere truism. Some nations have made great advances in civilisation, and others have either remained stationary, or have deteriorated. The Chinese appear to us to be exactly in the same state of civilisation as, probably less moral than, when Marco Polo and Duhalde travelled among them.

The Spaniards sent forth bold spirits, and their fleets were powerful, during the fifteenth, sixteenth, seventeenth, and eighteenth centuries. Civilisation, however far advanced in Spain, in cities and colleges, and among the Moors, could not pretend to the progress made in Italy and France. Instead of civil liberty and religious freedom, the most tyrannical absolutism, the most horrible ecclesiastical tyranny existed until the death of Ferdinand VII. The only part of the Spanish dominions in which civil liberty existed, were the least civilised; the provinces of Biscay, where the people taxed themselves and managed their own affairs, in virtue of their municipalities and *ayuntamientos*.

Civil liberty and religious freedom has often been proclaimed, but has not distinguished Spain, since the death of Ferdinand. The historical registers of that kingdom, will, from that period, constitute a record of interruptions to all security of person and of property,—of the presence of anarchy, and the absence of good, wise, or intelligent government,—of a continual routine of military executions, imprisonments, and confiscations. During the present day there is no country in which the Spanish language is that of the people, where anarchy, or absolutism, does not prevail; and there is not a railroad completed in any one of them, unless some temporary tram-road, laid down by an Englishman, to convey ore upon, or that constructed by the English and Anglo-Americans in Cuba.

Can we therefore be disappointed at the deplorable result of many and barbarous revolutions, and of the unhappy attempts at self-government in Hayti.

We have heard the success of the experiment extolled, as proving the full capacity for receiving intelligence, and of the wise and able exercises of the highest mental faculties, of the negro race. That natural disposition and capacity may be wonderfully changed and improved, is a truism,—that numerous instances, such as that of Toussaint and Christophe, exist, of extraordinary powers being displayed among them, we admit,—but that the negro race generally are not of great intellectual capacity, and that they are inferior to what some other races have been, or are, in a state of nature, all experience will compel us to admit.

What the destiny of Hayti may be, we will not attempt to determine: further than the revolutions of 1842-3-4-5 and 6, the expulsion of the president Boyer—the atrocities committed by the negroes on the coloured races, the contests and distractions between the former political men of the island,—the insecurity which prevails,—the non-payment of the instalments of indemnity to France,—the neglect of agriculture,—the consequent want of products for trade,—and the lax morals and indolence of the population, are all subjects, when deliberately considered, that do not leave us much good to hope for, in the prospects of Hayti.

CHAPTER IX.

STATISTICS OF HAYTI.

SINCE the expulsion of Boyer, our statistical materials, relative to Hayti, are scarcely in any case more than vague estimates. The trading regulations, and the customs tariff abound in the greatest contradictions and absurdities, fiscally and commercially. The great capabilities, and former commerce of Hayti, will be elucidated by the following tables, prepared by order of the French government:—

GENERAL State of Agriculture and Manufactures in the French Division of St. Domingo, in 1791.

These importations were made in 580 vessels, measuring together 189,679 tons, or by average 325½ tons each vessel, viz.:—

224 from Bourdeaux	10 from Bayonne	1 from Dieppe
129 from Nantes	5 from La Rochelle	1 from Rouen
90 from Marseilles	3 from Harfleur	1 from Granville
80 from Havre-de-Grace	2 from Cherbourg	1 from Cete
19 from Dunkirk	2 from Croisic	1 from Rhedon.
11 from St. Malo		

Add to the 580 vessels from France, 98 from the coast of Africa, and the French part of Hispaniola will be found to have employed 678 vessels belonging to France in the year 1788.

Foreign Trade in 1788 (exclusive of the Spanish).

Imported by foreigners (Spaniards excepted) to the amount of . . . 6,821,707 livres.
Exported by the same 4,409,922 „

Difference 2,411,785 „

N.B.—This trade employed 763 small vessels, measuring 55,745 tons. The average is 73 tons each. Vessels from North America (American built) are comprehended in it: but there were also employed in the North American trade 45 French vessels, measuring 3475 tons (the average 77 tons each), which exported to North America colonial products, value 525,571 livres.

And imported in return goods to the amount of 465,081 „

Difference 60,490 „

Spanish Trade, in 1788.

259 Spanish vessels, measuring 15,417 tons, or 59 tons each, imported to the amount of (chiefly bullion) 9,717,113 livres.

And exported negro slaves, and goods (chiefly European manufactures), to the amount of 5,587,515 „

Difference 4,129,598 „

N.B.—This is exclusive of the inland trade with the Spaniards, of which there is no account.

NEGROES imported into the French Part of Hispaniola, in 1788.

PORTS OF IMPORTATION.	Men.	Women.	Boys.	Girls.	Amount.	Vessels.

Total.....	15,674	7040	4245	2547	29,506	98

In 1787, 30,839 negroes were imported into the French part of St. Domingo.

The 29,506 negroes imported in 1788, were sold for 61,936,190 livres (Hispaniola currency), which on an average is 2099 livres, two shillings each, being about 60*l.* sterling,

The foregoing statements exhibit an extraordinary state of prosperity in the French division of San Domingo: that is, for an area less than one-third of the whole island. Toussaint and Christophe, who understood thoroughly the disinclination of the population to agricultural labour, may well be justified for the severity of their rural codes when we compare the San Domingo of 1790 to the island of Hayti in 1846.

TABLE of Exports from Hayti during the Years 1789, 1801, and from 1818 to 1826, both inclusive.

Nure.—In 1837 the quantity of coffee was only 30,845,400 lbs., logwood 6,036,238 lbs., cotton 1,013,171 lbs., mahogany 4,798,292 feet. According to official returns the quantity of coffee, exported in 1838 was 49,829,241 lbs., and in 1840 upwards of 50,000,000 lbs.; the returns of the chief articles of export during the intermediate year 1839 being as follows:—coffee 7,889,092 lbs., cotton 1,635,420 lbs., dye-woods 25,946,068 lbs., mahogany 5,933,477 feet, tobacco in leaf 2,102,791 lbs.; 31,186 hides.

In 1836, 369 ships of 50,380 tons, and with cargoes worth 474,789, entered, and 305 ships of 52,485 tons, with cargoes worth 621,336, cleared out of the principal port—of the former 4 ships with cargoes worth 102,262, and of the latter, 99 ships with cargoes worth 367,389, were British.

RETURN of British and Foreign Trade of Port-au-Prince during the Year ending
31st of December, 1841.

MEMORANDUM ON THE TRADE OF HAYTI DURING 1841.—There is a remarkable falling off in the trade of Hayti during the year 1841, when compared with the preceding year. This decrease may be accounted for, as arising from various causes, but chiefly from the deficiency in the coffee crop and the very great importations of 1840.

The necessary limitation of credit, which the merchants find indispensable to their interests, in consequence of the enormous debts already due by the country, may be cited as another influential cause of the decrease of commercial activity. It may also be remarked that the general poverty of the inhabitants, and the depreciation of the currency have both contributed towards lessening the demand for better description of goods, and have caused the substitution of those of a cheaper and coarser kind. British and German trade is sensibly affected by this change, whilst that with France suffers still more, there being but little demand for silks, cambrics, and wines. The American trade is carried on with some activity, but is far from being profitable to those engaged in it.

There is a considerable decrease (upwards of 12,000,000 lbs.) in the export of coffee—that amount being about *one-fourth* of the average crop. The value of the exportation

of this article, the staple produce of Hayti, is annually decreasing, owing to large supplies of coffee being now imported by European markets, from Brazil.

The export of cotton remains much the same, varying from 1,000,000 to 1,500,000lbs.; nor has the mahogany trade undergone any great variation during the last four or five years. There is, however, a falling off in the export of logwood, caused by its low value in Europe, and by the high rates of duty still maintained on its exportation.

Tobacco has of late years been much cultivated in the north-eastern parts of Hayti, and has well repaid the care bestowed upon it.

STATEMENT of the Receipt and Expenditure of the Republic of Hayti, during the Year 1837.

GOVERNMENTS OF ST. DOMINGO AND OF HAYTI, *December, 1846.*—In Domingo, or the Spanish part, Santa Anna, has published a constitution. It declares the limits of the republic to be the boundary of 1793—as appertaining to Spain. It declares the government to be *civil* not *military*, republican, popular, representative, elective, and responsible. The territory to be divided into five provinces: 1. Ampastella de Azun; 2. Santo Domingo; 3. Santa Cruz del Seybo; 4. La Concepcion de la Vija; 5. Santiago de los Caballeros. These provinces to be divided into communes. Citizenship is extended nearly to all—even to foreigners who pay a fixed amount of *taxes*. Sovereignty is vested in all the *citizens*. The executive is a president, with a legislative assembly, and council. In HAYTI President Riché has proclaimed the constitution of 1816, which is that already described as merely a transcript of that of France, with the exception of president for king, and *republic* for kingdom.

TONNAGE DUTIES.

HAYTI.—The tonnage duty heretofore exacted on foreign vessels, at one dollar Spanish per ton, is increased to two dollars Spanish per ton (consequently, American vessels pay two dollars and twenty cents per ton).

All foreign vessels, going from one port to another in this island, will pay for each port visited an additional duty of 100 dollars, Haytien currency, on vessels under 150 tons.

Vessels from 150 to 200 tons, pay 150 dollars.

Vessels of 200 tons and upwards, pay 200 Haytien dollars.

The duties on wharfage and weighage, on merchandise *imported*, are increased to double their former rates.

The “territorial” duty on exports is still in force; but the duty of exportation is reduced, which reduces the export duty on coffee from twenty dollars, Haytien currency, per 1000 lbs., to twelve dollars.

Cocoa from ten dollars to four, per 1000 lbs.

Tobacco, in leaf, from fifteen dollars per 1000 lbs., to five dollars.

Logwood, from seven dollars per 1000 lbs., to two dollars.

Mahogany, from twenty-two dollars to twelve dollars per 1000 feet.

Hides of all kinds are free of export duty.

The wharfage, and the weighage and measuring are to be added to the foregoing, as follows:

On coffee,	one dollar, Haytian currency.
On cocoa,	” ”
On tobacco,	” ”
On logwood,	” ”
On mahogany,	” ”
Hides are charged one cent, Haytian, each.	

The present value of a Haytian dollar is two-fifths of a Spanish or American silver dollar, or sixty per cent below their par.

SAN DOMINGO.—Foreign vessels to pay one gourde or dollar in silver per ton, about 4s. 3d. sterling. Those taking on board mahogany or other cargoes the produce of the soil.

CHAPTER X.

SPANISH WEST INDIES.

SPAIN, notwithstanding the revolt and independence of her vast possessions on the continent of North and South America, still possesses fertile and magnificent insular colonies, in the western hemisphere.

The Abbé Raynal observes, in describing Cuba,—

“ This, one of the largest islands in the world, served as the entrepôt of a great trade. It is regarded as the *boulevard* of the New World, and it has important productions. Under these aspects it merits serious attention.

"Cotton is the production, which may be naturally increased with profit in this island. At the time of its conquest it was very generally grown; now it has become so rare, that for years none of it has been exported.

"Although the Spaniard has an aversion, almost insurmountable, to imitate others, he has adopted in Cuba the culture of coffee; but in transplanting this production from foreign colonies, he did not imitate the activity which renders it valuable.

"Sugar, the most important production of the West Indies, would alone suffice to extend prosperity to Cuba; but the Spaniards have only a small number of plantations, where their best canes yield only a small quantity of inferior sugar.

"Spain possesses by far the most extensive and fertile part of the West Indian Islands. In active hands their islands would become the source of riches without limits; in their present state they are frightful solitudes.

"It would be calumniating the Spaniards to believe them incapable, by character, of laborious and painful industry. If we consider the excessive fatigues, which are so patiently endured by those, of this nation, who follow the contraband trade, it is evident they endure much greater hardship and fatigue than is experienced in rural industry. If the Spaniards neglect to enrich themselves by labour, it is the fault of their government."

Such was the state of Cuba about sixty years ago.

The colonies still possessed by Spain in America, are the magnificent and fertile islands of Cuba and Porto Rico.

CHAPTER XI.

CUBA.

CUBA is situated between the latitude of 19 deg. 50 min. north, and 23 deg. 12 min. north, and between the meridians of 74 deg. 8 min. west, and 84 deg. 58 min. west longitude. Its extreme length, following the centre, is calculated by some at 800 miles, by others, at not 700 miles. Its breadth varies from 20 to 130 miles. The area of this magnificent island is stated by Humboldt to be 3615 square leagues, or 32,535 geographical square miles. Mr. Turnbull's calculation is 31,468 square miles; that of its dependencies; viz., the Isle of Pines, 865; Turignano, 38; Romano, 172; Guajaba, 15; Coco, 28; Cruz, 59; Paredon Grande, 11; Barril, 13; De Puerto, 9; Eusenachos, 19; Frances, 14; Largo and other minor isles, 96; total, 32,807 square miles. If the latter is calculated as English statute miles there is a great discrepancy between the two estimates. We are inclined to believe in the correctness of Humboldt, as calculated in marine leagues, of twenty to the degree; viz., 220 marine leagues, in its extreme length, equal to 660 geographical miles, or $764\frac{1}{2}$ British statute miles.

The coasts of Cuba are generally surrounded with reefs and shallows, within which are low sandy beaches in many parts, or more generally a slip of very low land, frequently overflowed by the sea, and nearly always wet and heathy. The lagoons, within the beaches and sands, yield a good deal of sea-salt. There are, however, many excellent harbours.

A cordillera of calcareous mountains extends from one end of the island to the other. Its soil is generally fertile, except where the limestone rocks protrude over the surface. The forests of Cuba are still of great extent. Mahogany, and other useful woods, are among the large indigenous trees. Palmtrees and plantains are abundant. Maize is indigenous. Only one small animal, the Hutia, has ever been known as indigenous. As to its mineralogy, its copper mines are by far the most valuable. Coal, which is highly bituminous, follows next. Asphaltum, marble, and jasper abound. It is doubtful whether there were ever any gold or silver mines worked in this island. That found among the natives, is now supposed to have been collected by washing the sands, and accumulated during ages by them.

In agriculture, especially in the cultivation of sugar and coffee, the inhabitants of Cuba, aided by slave labour, have made great progress since the year 1809, when the trade of this island was emancipated from the restriction of trading to no foreign country whatever. The administration of Cuba has, since that period, published, with apparently great care, official returns of the population, agriculture, revenue, and trade of the colony. These returns, made under the direction of Don Rama de Sagra, were commenced during the administrations of the Captain-general Don Francis Denis Vives, and of the Superintendent-general Conde de Villanueva. We have from these returns formed the condensed tables which follow.

Population of Cuba.—The census of 1775, gave a population of 170,370; that of 1791 gave 272,140; that of 1817 gave 551,998; and that of 1827 gave 704,487 inhabitants; viz., whites, 168,653 males and 142,398 females; total whites, 311,051. Free coloured and negroes, 51,962 males, 54,532 females; slaves, 183,290 males, 103,652 females.

STATEMENT of the White, and Free, and Slave-Coloured Population, in each of the Departments of the Island of Cuba, in the year 1841.

DEPARTMENTS.	Cities & Towns.	Villages.	Hamlets.	Rural Districts.	WHITES.			FREE.		SLAVES.		GRAND TOTAL.
								Co-	Ne-	Co-	Ne-	
					Males.	Females.	TOTAL.	loured.	groes.	loured.	groes.

Eastern department.....	7	13	..	101	32,030	28,365	60,395	41,480	13,316	2,240	62,825	180,256
Total.....	22	108	96	279	227,144	191,147	418,291	86,054	64,734	10,974	425,521	1,007,624

Of the free coloured 43,658 were males, 44,396 females. Of the free negroes 32,145 were males, 32,739 females. Of the slave coloured 5868 were males, 5106 females. Of the slave negroes 275,382 were males, and only 150,139 females. Total free population, 571,129. Total slaves, 436,495. Excess of free over slave population 134,634.

There is a garrison of several battalions, and a small marine force.

Agricultural Returns.—In 1830, of the 468,523 caballerias of thirty-two English acres of land, which compose the whole territory, 38,276 were under sugar, coffee, tobacco, garden, and fruit cultivation, and 9734 in grazing-grounds, and in unfelled woods belonging to sugar and coffee estates.

	caballerias.
There were under sugar-cane plantations	5394
„ coffee-trees	5761
„ tobacco	1389
In lesser, or garden and fruit, cultivation	25,732
	<hr/>
Total caballerias	38,276
Total acres	1,224,832

It appears that there was an area of 430,247 caballerias, or 13,767,904 acres uncultivated in the whole island; some parts of which were appropriated to rearing and fattening animals, others to settlements or towns, and the remainder occupied by mountains, roads, coasts, rivers, and lakes; but the greater part were absolute wilds. The value of lands vested as private real property has been estimated as follows:—

	dollars.
32,857 caballerias in grazing grounds, for larger and for smaller cattle, and attached to Halos and Cerrales, at 100 dollars	3,285,700
10,752 ditto in grazing grounds, attached to estates, with enclosures, at 1000 dollars	10,952,000
15,300 ditto in sugar estates, at 1500 dollars	22,950,000
9,200 ditto coffee estates	13,800,000
20,732 ditto in smaller cultivation, provisions, &c., at 2000 dollars	41,464,000
2778 ditto in tobacco, at 700 dollars	1,944,600
	<hr/>
Total value of lands in 1830	94,396,300 dollars.

Those under cocoa or cotton, are supposed to be included in the above.

The buildings, engines, materials of labour, and other utensils of country estates, were estimated in value as follows:

	dollars.
On the wild pastures	1,737,000
On pasture or grazing attached to estates	619,600
On sugar estates	28,835,000
On coffee estates	20,000,000
On smaller cultivation	2,789,400
On tobacco plantations	622,850
	<hr/>
Total value of buildings, utensils, &c., 1830	55,603,850 dollars.

The value of the different products of cultivation were valued as follows, viz.,

	dollars.
Sugar-canes in the ground	6,068,877
Coffee-trees	32,500,000
Fruit-trees, vegetables, &c., of smaller estates	41,464,000
The same on the larger estates	5,476,700
Tobacco plants	340,620
	<hr/>

Total value of plants in 1830 85,850,197 dollars.

The value of the wood exported in 1830 was	dollars.
Ten times the quantity exported was consumed on the island	155,563
The charcoal consumed has been valued at	1,555,630
	2,107,300

Total annual value of the produce of woods . 3,818,493 dollars.

The minimum value of the forests of the island of Cuba was estimated in 1830 to be equal to 190,624,000 dollars.

Value of slaves in 1830; viz.,

	dollars.
100,000 slaves in sugar and coffee estates, at 300 dollars	30,000,000
31,055 ditto in smaller cultivation	9,316,500
7,927 ditto in tobacco	2,378,100

Total value of 138,982 slaves, supposed useful, at 300 dollars . 41,694,600 dollars.

The others being old or supposed of little or no value.

Value of live stock; viz.,

	dollars.
1,058,732 beeves and 893,538 hogs existing in the original grazing grounds	21,282,077
140,539 oxen for labour and hauling	7,026,950
186,973 horses, supposing 20,000 employed in other private uses, separate from estates	9,348,650
9642 mules and asses, deducting 10,000 which may be found in other occupations	772,860
46,962 sheep, goats, &c.	187,848
1,000,000 domestic breeding birds	1,000,000
Total value of animals	39,617,885 dollars.

We have no accounts of the present extent of cultivation in Cuba; but by comparing the value of exportable produce of 1830 with that of 1842, and by various estimates, we consider it probable that the lands under sugar, coffee, tobacco, and gardens, may fairly be estimated at 54,000 caballerias, or 1,728,000 acres. In 1840 the number of persons engaged in agriculture were, on 1238 sugar estates, 138,701 persons; on 1838 coffee plantations, 114,760 persons; and on 42,549 farms, 393,993 persons. Total number employed in agriculture, 647,454 labourers.

If we compare this extent with the remaining vast area of the fertile soils of Cuba, which are still uncultivated, and the produce which the whole island at present yields, it can scarcely be an exaggeration to say, that Europe might draw as much coffee and sugar from Cuba alone as the quantity at present consumed. But the process of reclaiming the forests and waste lands must necessarily be slow, even by slave labour; for that labour must not only be hereafter more limited, but it would appear from the returns of free labour in Porto Rico, and from the Prize Essay lately approved of in Jamaica, that free labour is cheaper than slave labour.

In 1760, the produce of coffee and sugar together, in Cuba, only amounted to about 5,000,000 lbs. Forty years afterwards the produce of both increased to above 40,000,000 lbs. In 1820, the exports increased to above 100,000,000 lbs.; and since that period the increase will appear by referring to the tables of the trade of Cuba, which follow. In 1800, there were, according to Don Sagra, but eighty coffee farms and plantations; in 1817, they increased to 780; in 1827, to 2067; at present it is estimated to above 3000. Tobacco is indigenous, and the best quality is grown, but it is said not to be profitable to the planter. In 1826, the exports of cigars amounted to 197,194 lbs.; in 1837, to 792,438 lbs. The culture of cotton and indigo is on the decline. Maize, rice, and plantains are abundantly grown, also potatoes and some wheat. Mr. Turnbull says, that burning the wood on the ground to be cleared deteriorates the soil: in North America, and even in Old Spain, it is burned to fertilise the soil. There is one railroad constructed; the common roads are very bad.

CHAPTER XII.

CUSTOMS DUTIES AND REGULATIONS OF CUBA.

THE customs and fiscal system of Cuba has been greatly improved since 1809. Differential duties on cargoes in Spanish and in foreign ships are, however, maintained.

IMPORT DUTIES.

The rate of duty charged on the importation of foreign produce and manufactures, in foreign bottoms, are $24\frac{1}{4}$ and $30\frac{1}{4}$ per cent on valuations attached to each article in the tariff, excepting flour, hogs, and tarred cordage, which pay a fixed duty; and as a general

rule, although there are a few exceptions, foreign produce and manufactures in Spanish bottoms, from a foreign port, pay $17\frac{1}{4}$ and $21\frac{1}{4}$, and Spanish produce and manufactures in foreign bottoms, from a Spanish port, pay the same; and foreign produce and manufactures in Spanish bottoms, direct from the Peninsula, pay $13\frac{3}{4}$ and $16\frac{3}{4}$ per cent.

Spanish produce and manufactures (except flour, which pays 10s. sterling per barrel), imported in Spanish bottoms, direct from the Peninsula, pay $6\frac{1}{4}$ per cent on the valuation in the tariff, but after having touched in any foreign port, they pay duty as if shipped from that port.

EXPORT DUTIES.

The produce of Cuba pays export duty at the following rates:

Foreign flag, for any port, $6\frac{1}{4}$ per cent upon the valuation of tariff.

Spanish flag, for a foreign port, $4\frac{1}{2}$ per cent ditto.

Spanish flag, for a Spanish port, $2\frac{1}{2}$ per cent ditto.

Except leaf tobacco, which pays $12\frac{1}{2}$, $6\frac{1}{4}$, and $2\frac{1}{4}$ per cent, according to the flag and destination; and clayed sugar, which pays 1s. 1d. sterling per 100 lbs. in foreign bottoms, and $11\frac{1}{2}$ d. sterling in Spanish bottoms; whilst rum, tafia, swine, horses, mules, horned cattle, cigars, and molasses pay the same duty in all cases.

On the total amount of all duties an additional 1 per cent is levied, under the denomination of "deucho de borlanza," and of late years an additional impost of one-seventh of the amount of duties has been added, to meet the expenses of the late war, except on the import of Spanish flour and the export of sugar, coffee, molasses, leaf tobacco, and cigars, which have had a fixed additional duty imposed.

Foreign flour remains untouched, the old duty amounting nearly to a prohibition.

On all bottled liquors there is a deduction made of 5 per cent on the duties, as a compensation for breakage; and on earthenware and glass 6 per cent for the same cause.

On jerked beef, from Buenos Ayres and Brazils, 14 per cent; from the United States and Campeachy 6 per cent is allowed for waste and damage.

There is also a small impost on imported liquors, to meet the expenses of the "casa de beneficencia" of the Havanna, at the rate of 2s. sterling per pipe, 1s. per cask or hogshead, 6d. per demijohn, and 6d. per dozen bottles.

Coffee pays an additional municipal duty of about 13d. sterling per 100 lbs.

Gold and silver, of the proper standard, when properly manifested and reported, may be imported free of duty, otherwise 4 per cent is levied. Gold pays an export duty of $1\frac{1}{4}$ per cent, and silver one of $2\frac{1}{4}$, but the duty is generally evaded, although at the risk of seizure both of specie and vessel.

Foreign agricultural implements and machinery, in foreign bottoms, pay $24\frac{1}{4}$ per cent *ad valorem*; but steam-engines for the use of the mines, ploughs, stallions, mares, rice-mills, and all implements for the manufacture of sugar, may be imported free of duty.

Cotton, green fruits, tobacco stems, syrup, and lime juice are exported duty free.

Sugar, coffee, cotton, tobacco in leaf, and cigars, air-guns, daggers, pocket-pistols, knives with points, and obscene prints, are not allowed to be imported; and books and printed papers generally are subject to the inspection of a censor before leaving the custom-house.

Gunpowder and muskets are the only goods allowed to be deposited at St. Jago de Cuba, and as the slave-trade falls off so does the deposit of these articles. The Havanna is the only general port of deposit in the island.

Merchandise having paid duty inwards pays none on exportation.

Every master of a vessel entering the port is obliged to present two manifests of his cargo and stores; one to the boarding-officers of the customs, and another at the time of making the entry and taking the oaths, twenty-four hours after arrival, with permission to make any necessary corrections within the twelve working hours; and every consignee is bound to deliver a detailed invoice of each cargo to his, her, or their consignment, within forty-eight hours after the vessel entering the port, and heavy penalties are incurred from mere omission or want of accuracy.

The total amount of duties paid upon the leading articles of *import* and *export* in foreign bottoms are shown in the following table, reduced to British money.

The tonnage duty on Spanish vessels is 5 rials, or 2s. 6d. sterling per register ton.

On foreign vessels, 12 rials, or 6s. sterling.

On vessels arriving in distress or in ballast, or departing empty, no duty is levied.

Beside the tonnage duty, every foreign square-rigged vessel entering with cargo and loading here, incurs about 17*l.* sterling expenses, with 5½ dollars or 1*l.* 2s. sterling for each day occupied in discharging. Foreign fore and aft vessels, pay about 3*l.* sterling less port charges. Spanish vessels incur nearly the same amount of charges.

Every vessel is required to bring a bill of health, certified by the British consul at the port of her departure, or at that nearest to the same, and want of attention to this rule subjects the vessel to quarantine.

The ton is composed of 20 quintals.

The gallon in use here is equal to that of the English old measure.

The dollar is worth about 4s. sterling: the foregoing calculations are at that rate.

The Sevillian piseta, worth one-fifth part of a milled dollar, is the coin chiefly in circulation in this part of the island; it was permitted to be imported up to the year 1831, at the rate of four pisetas to the dollar, and consequently has driven almost every other coin beyond its aliquot parts out of circulation. The Spanish government, however, at length aware that smuggling transactions in these pisetas were carried on to a great extent, have lately issued an order reducing them to their proper value, and paying the holders the difference of 20 per cent in coupons to be redeemed hereafter at the will of the authorities.

TONNAGE DUTIES AND PORT CHARGES.

Tonnage duty on Spanish vessels 62½ cents; and on foreign vessels 8 dls. 50 cts. per ton.

In the port of Havanna an additional duty is exacted of 21½ cents per ton on all vessels, national or foreign, for the support of the dredging machine (pontón).

The wharf dues in Havanna are on Spanish vessels, 75 cents per day; other nations 1 dlr. 50 cts. per day for each 100 tons of their register measurement.

Lighthouse dues, officers' fees, &c., are not estimated, there being no official information in the department with regard to them, except for the port of Baracoa. The port charges differ in the various ports; those of Baracoa are:—tonnage duty, 1 dlr. 50 cts. per ton; anchorage, 12 dls.; free pass at the fort, 3 dls.; health officer's fee for boarding vessels, 8 dls.; custom-house interpreter, 5 dls.; officer's fee to remain on board to seal and unseal while discharging, 5 dls.; inspecting vessel's register, 8 dls.; clearance 8 dollars.

The collection of the duties is made in a very simple manner. The island of Cuba is divided into customs' intendancies, of which Havanna is the principal.

The intendancy is organised into seven branches; viz., the intendant, the superior council of the hacienda, the tribunal of accounts, the accountant-general, the treasurer-general, the administration of the customs, and the administration of the internal revenue. The administration of the customs is comprised of the administrator or collector, the accountant, and the treasurer.

When a vessel arrives at the Havanna, she is first boarded by the health officer; after whom comes the revenue officer, and the smuggling preventive service.

A copy of the custom-house regulations, in Spanish, French, and English, is handed to the captain, and a manifest required of him of all the particulars of his vessel and cargo. Every article on board the vessel omitted in the manifest, is subject to confiscation.

Within forty-eight hours after the entry of the vessel, every consignee must deliver a detailed statement of the articles coming to him, with their quantities, weights, and measures, all reduced to the legal standard.

All the documents and papers relating to a vessel are stitched together in a book, with the signatures and seals of all the government officers through whose hands the several documents pass. A copy of this book is made for the use of the inspectors and appraisers; the latter function being restrained within very narrow limits, by a printed tariff of all articles of import, with a valuation to each, which valuation in a great degree defines the duties of their *ad valorem* character. As fast as the inspection and appraisement takes place, the consignee is permitted to remove the goods, by procuring the signature of some responsible person to the words inscribed in the book, "I make myself answerable for the duties." The inspection and appraisement being concluded, the book is returned to the accountant's office where the liquidation of the duties is forthwith made.

The payment is then proceeded with. These payments are mostly cash; that is to say, on some articles, whatever may be the amount, cash is required; upon other articles the duties are cash under 1000 dollars. If the amount is greater, a credit of one-fourth is given for sixty days, and one-fourth payable at the end of each succeeding month—making five months' credit in all. The security for this credit consists simply in the promissory note of the consignee, without endorsement, with the power, in case of a failure, to convert every other note of the same individual into a cash debt; the individual to be for ever after incapacitated to enter goods except for cash.

This system has been in force many years, and under it no loss whatever has been sustained by the government.

Formerly the same credits required the endorsement of a holder of real estate, but this was abandoned on account of its insecurity.

The exports of the island produce are generally for account of speculations, sometimes for account of European refiners, and rarely for account of the planters. The chief speculators are the United States and European merchants. Shipowners, and merchants in Cuba, often take interests in cargoes, and some are shipped on account of speculators at Havanna. The produce being always purchased for cash, it is sometimes done with the nett proceeds of imports. Sometimes specie is imported for the purpose; but a large proportion is paid for by bills of exchange. Drawers of bills, of good character, can always sell them to any amount. When abroad, bills are not in demand; returns for imports are made in produce for account of their owners, instead of being made in bills drawn against the same produce for account of some speculator.

Money accounts are kept in pesos, reals, and maravedis. The peso, or dollar, is equal to 8 reals plate, or 20 reals vellon. The real plate is equal to 34 maravedis. By the act of Congress of 1799, the real of plate is estimated at 10 cents, and the real vellon at 5 cents, and they are so calculated at the custom-houses. There are, also, as in other parts of the Spanish dominions, halves, quarters, eighths, and sixteenths of the dollar.

The gold coins are the doubloon, and its subdivisions. The doubloon is equal to 8 escudos d'oro, or gold crowns, and is legally worth 10 dollars, but the price varies, according to weight, and sometimes to demand.

Weights and Measures.—The pound is equal to about 1 lb. 4 drs. avoirdupois; making 100 lbs. or libras, equal to 101 lbs. 7 oz. avoirdupois.

The subdivisions are:—36 grains = 1 adarme; 2 adarmes = 1 drachma; 8 drachmas = 1 onza; 16 onzas = 1 libra; 25 libras = 1 arroba; 4 arrobas = 1 quintal.

The vara is equal to 33,384 inches, or 108 varas = 100 yards. The fanega is equal

to 3 bushels nearly, or 200 lbs. Spanish. The arroba of liquid measure is equal to 4245 gallons.

Imports and Exports of the Precious Metals to and from Cuba.

The regulations in regard to, and the expense of, the entry of goods in the island of Cuba, may best be understood from the actual disbursements on account of a British or other foreign vessel, as follows:

DISBURSEMENTS BY A FOREIGN SHIP-MASTER AT THE PORT OF HAVANA.

	dollars.	dollars.
Custom-house entry and stamp	3 25	
Harbour-master's fees, in and out	6 00	
Board of health	2 00	
Marine interpreter	2 00	
Translating manifest	10 00	
	<hr/>	23 25
Tonnage duty on 160 4-95 tons, at 1 dollar 50 cents per ton, and 1 per cent "balanza" duty on amount of said tonnage	393 94	
Wharfage from 10th to 23rd instant, inclusive, fourteen days, at 1 dollar 25 cents per day on each hundred tons, 260 tons	45 00	
Stage hire fourteen days, at 75 cents per day, and 3 rials for carrying the same	10 88	
Mud-machine, 1½ rials per ton, and 1 per cent "balanza"	57 44	
	<hr/>	507 26
Custom-house clearance, and bills of discharge:—		
Eleven days' discharge, at 5 dollars 50 cents per day	60 50	
Two visits, in and out	11 00	
Seven sheets of extracts, each 1 dollar	7 00	
Clearance	8 00	
Stamp paper for clearance	8 25	
	<hr/>	94 75
Light money	4 00	
Moro pass, governor's fee, and clearing officer	4 00	
Certificates of duties being paid	4 25	
Custom-house broker	3 00	
	<hr/>	15 25
The following are not government charges, but in continuation, &c.:—		
Bill of health, 7 dollars; Russian consul's certificate, 8 dollars 50 cents; Danish consul's certificate, 5 dlns.	20 50	
	<hr/>	20 50
Cooper's bill for repairing casks	9 94	
Journeymen for discharging cargo, twelve days, for six men, each 75 cents per day	54 00	
American consul's bill	10 25	
Lighterage on 1573 boxes sugar	157 25	
Trip on board	0 40	
	<hr/>	231 84
Total		892 85

To which add commission, 2½ per cent.

During the time a vessel is discharging, a government officer is stationed on board, and is required to report daily to an officer of the custom-house; and for each report the vessel pays 5 dollars 50 cents. The charge is the same, whether one barrel or a thousand is discharged each day. A vessel loaded with jerked beef pays 5 dollars 50 cents for every 500 arrobas, or 12,500 lbs., without reference to the quantity discharged each day. Lumber pays 5 dollars 50 cents for every 20,000 feet. Cotton, the same for every 60 bales. Salt cargoes, 5 dollars 50 cents per day. Logwood a like sum for every 800 quintals.

and the same amount for every 25 tons. Three copies of the invoices of all cargoes are made out to the custom-house on Spanish stamped paper; and for each leaf is charged 1 dollar. It frequently happens that thirty to forty sheets, of not more than four to five lines each, are required from vessels from New York, Havre, and Liverpool. These are some of the vexatious extortions which are allowed to interfere seriously with the interests of that magnificent island. The following is a statement of the ships that have arrived and sailed from each part of the island :—

The United States, it appears, supplies but a very small proportion even of those manufactures of which she has the best means of producing. Nearly all the manufactures coming from England are in Spanish bottoms, while American manufactures are in United States vessels. Spanish vessels can go to England, take in cotton goods, and carry them to Cuba, on better terms than American vessels can carry them direct. This is a singular fact, and is to be accounted for only on the ground that the paper currency of the United States carries the level of prices too high to admit of profitable shipment to the specie prices of Cuba. This view is confirmed by the fact that, during the six months which has elapsed of the year 1843, cottons have been exported from the United States to an amount far greater than ever before. A difference in the currencies of the two countries forms an insuperable bar to equality of intercourse.

VALUE of Exports from the Island of Cuba.

The sugar imported into England from Cuba, as well as that from Brazil, has chiefly been refined in bond. The sugar exported from Brazil to Trieste, and to many other continental ports, those of France, Portugal, and Spain excepted, has been chiefly in British ships.

CHAPTER XIII.

SEAPORTS OF CUBA.

THE Havana, Spanish Habana, or as pompously styled in official language, "*La Siempre Fedelissima Ciudad de San Cristobal de la Habana*," is justly described as one of the best harbours in the world. The population, in 1827, consisted of 46,621 whites, 23,562 coloured and black free people, and 23,840 coloured and black slaves. Total, 94,023. Including the garrison, the present population is considered little if at all under 150,000.

The streets of Havana cross each other at right angles, and extend in straight lines from one side of the city to the other. In 1584 there were only four, and the notaries in those days commenced certain deeds with "*la publicá en las cuatro calles de esta Villa*."* In consequence of their regularity they do not now exceed fifty within the walls.

"They are all," says the author of a recent book, 1845, "*McAdamised*, thanks to the energy of Tacon, but their want of width has prevented the formation of sidewalks; unless the narrow row of flag-stones close to the houses, and which are often below the level of the street, may be so named. These are not unfrequently used in common by the carts and pedestrians; and in wet weather, forming as they do the inner boundaries of the side gutters, are scarcely preferable to the middle of the street. It is not, therefore, surprising that the ladies of Havana do not promenade in the city; indeed, the absence of the female form in the busy crowds that pass before the eyes of the stranger, constitutes one of its most striking features.

"In the more frequented channels of the city, considerable skill is requisite to wend your

* *La Habana en sus primeros dias.*

way safely. Besides a multitude of narrow carts, which, however, are supported on iron wheels so low that you might easily pass over one, if it obstructed the way, there is the lumbering volante, with its long shafts and ponderous wheels, rolling close by you at every moment. The horse trots leisurely on, so that if he does strike against you, it may be accepted as a friendly warning of the approach of the vehicle, for none is ever given by the postilion, and he is so far in advance of the wheels that you can very easily escape. Add to these the heavy ox-cart, with its team of well-broke cattle; long trains of pack-horses, with their cumbrous loads of charcoal, green fodder, or poultry; mounted horsemen, urging their steeds to their utmost speed, whenever the course is clear for but a short distance; and innumerable negro porters with wheelbarrows, or carrying huge loads on their heads—and some idea may be formed of the principal thoroughfares of the city. When the crops of sugar, molasses, and coffee, are brought here for exportation, they are sometimes so blocked up by the laden carts, and the whole place becomes so filled with the accumulated produce, that it is not unusual for the captain-general to grant permission to labour not only on the Sabbath, but during the whole of each night, which is never otherwise permitted among the warehouses and shipping.

“The *calle des Mercaderes* is the principal street for shopping, and contains many fine and extensive stores, filled with choice dry goods, jewellery, china, glass-ware, &c. These are designated by different names, which, however, have no reference to their contents—as ‘the bomb,’ a favourite one, ‘the stranger,’ ‘virtue,’ &c.; but the name of the owner never appears on the sign-board. The principal commercial houses have neither sign nor name, and can only be distinguished from the larger private dwellings by the bales of goods, or boxes of sugar and bags of coffee that are piled up in their lower stories; the merchant and his family, and clerks, living in the upper part.”*

* Nearly all the retail shops are owned by Spaniards, and, with very few exceptions, none but men are seen behind the counters. The Parisian shop-girl, so celebrated for her skill in selling, might, however, here learn a lesson, not only in *overcharging*, but also in that assiduity in serving, that will scarcely permit the visitor to leave without purchasing something. Let the novice take care how he offers one-half the price asked for an article, if he does not wish it, for that, not unfrequently, is its real one; in almost every case, one-fourth will be deducted. “How much for this xippe-xappee?” (hippee-happee) I inquired of a hat merchant. “Twelve dollars.” “I will give you six.” “Say eight.” “Only six.” “It is a very fine one, señor, take it for seven;” and finding that was about its value, and longing to exchange my beaver for a Panama, more suited for the heat, I closed the bargain.

“You shall have this cane for a dollar,” a Catalan said to me, as I was examining his various articles spread out under one of the arcades near the market; not wishing to buy it, I offered two rials, when he handed it to me. I gave him two *reales sevillanas*, but he insisted on *fuertes*, and I got my cane for one-quarter the price asked. A cane is an inseparable appendage to the exquisite, it is still used as an insignia of several professions. Thus, the doctor is here still recognised by his ebony cane with its gold head and black tassels, and some public officers are distinguished by theirs.

“Although the *calle des Mercaderes* is the Bond-street of Havanna, retail shops are scattered all over the city, which in a large part seems to be made up of them, the lower stories of many of the dwelling-houses being thus occupied. The ladies in shopping do not in general leave their *volantes*, but have the goods brought to them, the strictness of Spanish etiquette forbidding them to deal with a shopman; and it is only when the seller of goods is of their own sex, that they venture into a store. The custom of appearing in public only in a volante is so general, that some of my fellow-boarders, American ladies, who ventured to do their shopping on foot, were greeted in their progress by the half-suppressed exclamations of the astonished Habaneros, who seemed as much surprised to see a lady walk through their streets, as a Persian would to see one unveiled in his.

“I have said that Spaniards are chiefly the owners of the stores, the Creoles being seldom engaged in commerce. Those containing dry goods belong generally to Asturians, while the sale of groceries and provisions is monopolised by Catalans. These latter are an industrious, shrewd, economical class; and have, perhaps in consequence of these qualities, received their *sobriquet* of Spanish Jews, which can only be construed into a compliment to the Israelite. A large portion of the commerce of the island is in their hands, as well as a very great part of its wealth. In the interior of the island they appear to monopolise every branch of trading, from the pack of the

"The substantial manner in which even the most unimportant building is constructed attracts attention ; every one seems made to last for ever. The walls of a single-story house are seldom less than two feet in thickness ; and to witness the erection of those of the larger ones, the masonry might readily be mistaken for that of some embryo fortification, destined to be cannon-proof. Many of the private dwellings are immense structures. I was shown one belonging to one of the Gomez, that cost 500,000 dollars ; and without the walls, facing the military parade-ground, another was nearly built, which, with its pillars and arches, occupied a front as large as some of the minor palaces in Europe. The value of real estate is very high in Havana ; a lot about sixty feet square, on which a store was afterwards built, sold a few years ago for 40,000 dollars, and the hotel of my host, that can accommodate from thirty boarders comfortably to sixty packed away, as they often are here, commands a rent of six thousand dollars. With such a value set on the land, but little is appropriated to yards, and the whole city may be said to be divided into squares of solid blocks.

"The architecture of the larger houses is heavy. They are so constructed as to form open squares in their centres, their only yards, where sometimes a few shrubs planted in boxes serve to relieve the eye, and upon which the lofty arches of the corridors look down. The lower story is occupied by the store-house, reading-room, kitchen, and stable ; while the common entrance is often half blocked up by the volante, its arched passage serving for a coach-house. From the side of this latter a wide flight of stone steps leads to the corridor of the second story, into which all the rooms open, and which forms the common passage to all of them. It opens itself on the central square, and the spaces between its heavy pillars and high-sprung arches, are generally closed with Venetian blinds. An air of rude grandeur reigns throughout the whole structure, the architecture partaking of a mixture of the Saracenic and Gothic styles. The chief hall or parlour is generally from forty to fifty feet long, twenty wide, and as many feet high ; while the windows and doors, reaching from the floor to the ceiling, render it cool and pleasant during warm days, but afford little protection against the damp northers. The floors are all stuccoed or tiled, and the walls and ceilings not unfrequently ornamented with fresco ; while only here and there, a few panes of glass let into the thick shutters, serve to admit the light when they are closed."—*Notes on Cuba*, 1845.

This description, written by an intelligent citizen of the United States, differs little in character from some of the towns in Spain. The town houses are like fortresses.

"Every window accessible either from the street or the roofs of the neighbouring houses, is strongly barricaded with iron bars, while the stout folding-doors, guarding the only entrance to the whole building, would not be unfit to protect that of a fortress. They are castellated palaces ; and with their terraced roofs, their galleries and passages, their barricaded windows and ponderous doors, remind one of the olden Saxon strongholds, which Scott has so graphically described.

humble pedlar to the country tienda with its varied contents ; and in the maritime towns, many a commercial house, whose ships cover the sea, is theirs.

"Under the arcades near the markets in Havana, may be seen a number of shops not ten feet square, with a show-case in front, before which a restless being is constantly walking, reminding one of a caged wild animal that chafes for a wider range. At night the show-case is carried into his little cabin, which serves him for shop, dormitory, and kitchen ; and where he may be often seen preparing his frugal meal over a chafing dish of live charcoals. 'Five years of privation and a fortune' is his motto ; and not a few of the wealthiest Spanish residents in Cuba may date the commencement of their prosperity from as humble a source. The greater part of the trade with old Spain is in their hands, and they have latterly also extended their correspondence to other countries, and entered into active competition with the resident foreign merchants. The Catalan, moreover, furnishes the planter with all the necessaries for his negroes and plantation ; advances moneys for his crops, which he then sells on commission ; and often loans to him the requisite sums to erect his costly sugar works, or make his less expensive coffee estate, but all at an interest, ruinous in the present depreciated value of his crops."—*Notes on Cuba*.

"There is no West End in Havana; the stately mansion of the millionaire is often in juxtaposition with the magazine of *tasajo*, jerked beef, with its sign of a large slice swinging over its door, and its putrid-like odours tainting the air; or its basement occupied by the *tienda*, with its stock of lard, garlic, and groceries, or the workshops of the humble artisan. Many of the dwellings are, however, of only one story, and their parlours are completely exposed to the gaze of every one, through their large windows, which open on the street. Two rows of arm-chairs, facing each other, are placed near these, where, during the evening, the older members of the family may be seen seated with their visitors. The younger ones stand within the windows, looking through the interstices of the iron bars at the pedestrians, and occasionally enjoying the conversation of an acquaintance as he loiters for a moment to pay a passing compliment."

All sorts of goods are sold in the shops. The markets of Havana are well supplied: the fish market is extolled.

In 1610, an old hospital was the only place of worship in Havana, which the inhabitants complained could not accommodate one-eighth part of those who desired to partake of the sacrament. They petitioned the king, through their new bishop, to aid them in the erection of a church, and to remove the cathedral of St. Jago de Cuba to their city, as the latter place was badly fortified, and the church there had been already sacked by pirates of all its chalices, &c.* It now contains sixteen churches, built without much attempt at architectural beauty.

The great wealth once possessed by the monks in Cuba is well known. They owned large tracts of the richest soil on the island, and their revenues from their plantations were very great. Their possessions have all within late years been confiscated, and with them their power has passed away. Most of them have left the island, their number in Havana, by the census of 1842, being reduced to 106, to which may be added 188 nuns—all that now remain of those once numerous bodies. Two of their establishments, St. Augustine and St. Domingo, have been converted into storehouses by the government for its use, and severe restrictions are imposed on all who still retain the order.

Of all the numerous monastic orders, who must once have swarmed in the city, but one or two monks only are now occasionally seen passing through the streets. Although their rich cane fields and valuable coffee estates have long been advertised for sale by the government, few purchasers have as yet been found. Much of their landed property had been bequeathed to them for the express purposes of religion; and the fear that if bought by individuals, lawsuits might hereafter be instituted for its recovery, has deterred persons from buying, for no faith is placed in the government substantiating the claims of the purchasers.

"The church of San Felipe is the resort of the fashionable, and having seen service performed in the more humble edifice of Santa Clara, I took my seat the next Sunday among the worshippers of this. It was the anniversary of Santa Lucia, and the church was nearly half filled with gentlemen, among whom were a few military officers in rich uniforms. Not more than a dozen ladies were present, the rest of the females were coloured, and there were only a few children. The central benches were occupied by the gentlemen alone, but the two races were not separated; and here, as in Santa Clara, the

* *La Habana en sus primeros dias.*

coloured mostly were near the sacristy ; one old woman, in a shabby attire, kneeling on the very steps, and almost touching the gown of the officiating priest."—*Notes on Cuba*.

The cathedral is situated near the mansion of the captain-general, in the Calle del Ignacio, with its towers and pillared front of discoloured and worn stone.

But the chief object to which the attention of every visitor is invited, is a tablet of stone, inlaid in the wall, to the right and in front of the altar, with the bust of Columbus sculptured on it, in basso-relievo, above the opening of what is called his tomb.

The large convent of San Juan de Dios is now used solely for a hospital. It is a huge building, with high, unornamented walls without and within, of irregular construction, with a double gallery open to the central square court.

The great prison of Havana is a large building, erected by Tacon, during his residence on the island, and is situated without and near the gate of La Punta, not far from the sea. The fresh breezes circulate freely through it, and protects its inmates from the pestilential fevers which generate in crowded and ill-ventilated rooms. It is quadrangular, each side being about 300 feet long and fifty high, and encloses a central square planted with shrubbery, and watered by a handsome fountain. It can contain 5000 prisoners, and has had more than 1000 within it. The style of its architecture is simple but massive ; and, although unenclosed by walls, and built with care for the health of the inmates, its strongly ironed barred windows and doors, and the guard of soldiers, afford ample security. It is said, its erection did not add to the expenses of the city ; as it was built by the labour of the convicts, and with funds which, before the administration of Tacon, had been dishonestly appropriated by the civil officers, and of which he deprived them.

Tacon greatly improved the streets and passeos. The disorganised state of the country before the absolute rule of Tacon is well known. He put a sudden check to murder, robbery, and fraud, and impressed on a people, whose corruption was proverbial, some regard for honesty, which has outlived his administration.

The American writer whom we have quoted, says of Tacon,

"Neither the noble nor the mean, the rich nor the poor, were shielded from the law. There was none of that mawkish sensibility present with him that has become of late so fashionable with us, and of which our increasing cases of crime are in some measure the fruits. Punishment surely and quickly followed on the conviction of the accused ; and the head of the murderer was often hung over the spot of the assassination, as a warning to his comrades.

"In consequence of this even-handed justice, while he restored quiet to the country, and rendered the highway as safe as the public streets, he made many enemies among the rich, who had hitherto rode rough-shod over the poor ; and they preferred charges against him for unnecessary cruelty. He referred his judges to the annals of the court, and it was found that fewer punishments had been inflicted by him than by the former governors, during the administration of whom murder and robbery had stalked unchecked in open daylight, even in the streets of Havana.

"The means he adopted to effect this change, it is true, savoured in some cases more of the camp than of a court of law. The captains of partidos, county magistrates, were made answerable for the robberies committed in their districts, unless the robber was sent to Havana. Men were sometimes taken suddenly from the midst of their families, where they lived in fancied security, were shown the indisputable proofs of their guilt, and at once exiled from the island as inimical to its government."—*Notes on Cuba*.

During the carnival at Havana, the theatre is transformed into an immense mask-ball-room; and the streets are filled with the most grotesque characters. The latter frequently stop before the grated-windows and dance to the music of the guitar or tambourine, the family coming forward to the window to enjoy the outside drollery; others, habited as Turks, Jews, and other nations, parade the streets. On Good Friday, all the church-bells are mute; in some places their peals are made to imitate thunder. The yards of all the Catholic ships are also crossed, and a figure representing Judas is hung by the neck from some conspicuous point; in country villages, the *monteros* amuse themselves by shooting at him. The crucifixion, burial, and resurrection, are also acted.

The possessions of the church have been confiscated, but the tithes are still collected, and it is said, that most of the money is appropriated to other purposes than the support of religion. The people feel most sensibly every additional tax on their resources. The expulsion of the monks is an advance towards religious liberty; but no permission has been obtained to erect a chapel in Havana for Protestant worship.

The history of Havana comprises much of that of Cuba. It forms a key to the Gulf of Mexico, and all its channels. San Cristóbal de la Habana, according to Solís, Herrera, and other early historians, was at first established on the south coast of Cuba near Batabano; but on account of the insalubrity of the spot it was translated, in 1519, to its present site, on what was then called the Port of Carenas.

Its judicious selection became soon evident by the relief which it gave to many vessels that were wrecked on the neighbouring coasts, and on that of Florida, particularly on the *Matacumbi* rocks; where, besides others, the whole fleet of Don Rodrigo de Torreo, with the exception of one vessel was lost in 1733. It was chiefly from this port that the early discoverers of much of Mexico and of Southern America sailed.

The governors at first resided in St. Jago de Cuba, which, besides containing the cathedral, was near to Hispaniola, the head-quarters of the Spaniards. In 1538, Hernando de Soto took up his residence in Havana. In 1607, when the island was divided into two departments, the military chiefs and the bishop made it their chief residence. In 1538, it was surprised by a French corsair, who reduced it to ashes; and during this century and the beginning of the next,

* Morel, Vida de este obispo.

about 16,000 of the inhabitants of the islands flocked to the vicinity of Havana in order to avoid the depredations of the Buccaneers. In an attack on St. Jago de Cuba, the pirates sacked the cathedral; and their chief, Giron, carried off the bishop a prisoner, who, after eighty days' captivity, was ransomed for 200 ducats, 1000 hides, and 125 lbs. of beef.

In 1655, the English attempted to take Havana by assault, but failed with great loss.* In 1762, however, the English captured the city, attacking the defences by sea and land, making a breach in the Morro.† The British fleet, consisting of fifty-three vessels, carrying 2268 guns, was commanded by Sir George Peacock; and the army, numbering 12,041, and 2000 more from New England, Virginia, and Jamaica, under George, Earl of Albemarle. Three bomb-ketches, carrying twenty-four bombs, were attached to the fleet. To oppose this force, the Spaniards had sixteen vessels in the port, carrying 890 guns, while the city and the Morro were defended by 250 more, of which only one was a forty-two pounder, and six thirty-six pounders; besides these they had eleven mortars. Their army numbered 13,610 Spanish troops, and 14,000 militia and coloured men. The Morro was obstinately defended by Don Luis Vicente Velasco, who refused to capitulate, and was mortally wounded in the final assault of the English. He died in twenty-four hours after; and in perpetual commemoration of his indomitable courage, Charles III. commanded that there shall always be one of the vessels in the Spanish navy bearing his name. After retaining possession of the whole island for about one year, it was restored to Spain.‡

The number of war vessels built at Havana from 1724 to 1796 amounted to fifty-one ships of the line, twenty-two frigates, seven barks, nine brigs, and twenty-five smaller crafts; in all 110, carrying 5068 guns: six rated above 100 guns each, among which was the *Santissima Trinidad*. In 1844 the Cuba navy consisted of one frigate of forty-four guns, two or three steamboats built in the United States of five guns each, and sixteen other crafts, carrying from one to sixteen guns; in all carrying about 190 guns. The fortifications, whatever may be the number of guns under cover, have very few mounted, and those of not a large calibre. The harbour of Havana is one of the safest in the world, being land-locked on all sides but the north, where its entrance is only 1000 feet wide, with the gulf-stream flowing deeply before it. It has about six fathoms of water within, and is sufficiently capacious for about 1000 vessels.

* "The Spaniards say, the English were repulsed by a miracle, the memory of which is still perpetuated by the name of *los congrejos*, the crab miracle. It is related that they disembarked on the coast during a dark night, but became so alarmed by the noise of the crabs among the dead leaves of the mangroves, which, with the lights from an immense number of *coculos*, induced them to believe they had fallen into an ambush, that, filled with terror, they fled to their boats in the greatest disorder."—*Notes on Cuba*,

† The Morro was first built in 1633; the present one was erected on the ruins of the first, destroyed by the English. La Punta, La Estella, and Santa Catalina, were built in 1664.

‡ *Apuntes para la Historia de la Isla de Cuba*.

The first church in Havana was built on the spot now occupied by the mansion of the captain general; an attempt was made by the Senor Laso to demolish it, and build another on the site; but it continued to be used as a place of worship until the expulsion of the Jesuits, when the present cathedral was erected. In January, 1607, one of the prebends of the canon was suppressed, to give place for the tribunal of the Inquisition, which was held in the church of San Domingo. This huge edifice is now used as a government wood-yard.

Besides the Royal University, including a medical and law school, and chairs for the natural sciences, it contains several other learned institutions. Among these are the Royal Seminary of San Carlos y San Ambrosio, founded in 1773; a seminary for girls, founded in 1691; a free school of sculpture and painting, founded by the Sociedad Economica in 1818; a free mercantile school, and some private institutions for primary instruction. A museum of natural history was established in 1838, and the naturalist, Don Felipe S. Poye, appointed director; without the walls there is a botanical garden under the especial care of a professor of botany, Senor Auber. The means of education are, however, far from being ample, and many of the wealthier families send their sons to Germany, France, and the United States, and on their return they are greatly divested of Spanish prejudices, and no doubt impart liberal and intelligent views to those with whom they afterward associate.

The *Real Sociedad Economica de la Habana*, formerly called the Patriotic Society, was established in 1793; and is divided into three principal sections, on education, agriculture, and commerce and popular industry; a section, on the history of Cuba, has been added. It has a public library, in the old convent of San Domingo, that is open to all, daily, except on Sundays and festivals. This really useful society publishes a monthly report of its labours, which contains, also, besides contributions from its members, extracts from foreign journals. It records the general statistics of the island, and collects fragments of its early history: it has corresponding branches in nine of the principal towns of Cuba.*

The medical school was re-organised in 1842, and the present requisitions for graduation, are a classical education, and six years' study of medicine. *Foreign candidates* for licences to practise medicine or surgery, are now compelled to pass through a most rigid and expensive formality, which costs about 400 dollars. Several of the professors are Frenchmen.

* Among the subjects for which premiums were offered by this society in 1839, were the following: For the best Essay on Free Schools. For one detailing the advantages of free commerce to a nation. For one on the introduction of steam-power on sugar estates, and the foundation of a school for native machinists and engineers. For one on the necessity of augmenting the number of the white population in Cuba, and the possibility of substituting white for black labour on sugar estates, with calculations on the cost, &c. The diploma of a *Socio de Merito* of the Society was also offered to any one, who, after three years, produced 200 boxes of sugar from an estate thus worked. For one on the breed of cattle, &c. For one on the relative value of railroads and coasting vessels in Cuba. For one demonstrating the means to correct the habits of the country in its present state.—*Notes on Cuba.*

There are twenty-six printing establishments in Cuba ; thirteen of which are in Havana ; one founded in 1735, one in 1747, and one in 1787 ; and ten in the other principal cities. The periodicals published in Havana, besides the memoirs of the Patriotic Society, and a medical journal, are three daily papers, and one three times a week. Matanzas, Puerto-Principe, Trinidad, Villa-Clara, Santi-Spiritu, and St. Jago, have each one newspaper. The *Corres del Ultramar*, a weekly paper in Spanish, printed in Paris, and containing a condensed report of European news is also received in Cuba. Almost all the American and English newspapers find their way into the island, through the commercial houses in the maritime towns, but these are of no use to the Cuban, from his ignorance of the English language.

The American author already quoted, says—

“ The character of some of these papers, in point of literary contributions, is, however, as good as that of many in the United States ; while although the people dare not through their columns give utterance to the least complaint against the government, they are also free from that scandal that sullies the pages of some of the presses in our own country and England. Nor is the censorship confined to the politics of the island. A quack medicine, which had been puffed through its advertisement in one of the Havana papers, was found on trial to be deleterious, and to have caused the death of several persons. To guard against future similar accidents, a medical censorship was also established, to which the ingredients in all quack medicines must now be confided, before they can be recommended through the papers. Metaphysical, scientific, and moral subjects are often well discussed in the *Diario* and *Noticioso of Havana*, and rival in their excellence many of the contributions to our periodicals. Indeed, whoever takes up one of these papers will soon perceive that there is no lack of talent or learning in Havana, but it is confined to the few. The mass of even the wealthy population are not liberally educated, and of the poorer classes, very many are ignorant of the first rudiments, reading and writing. Over every effort to instruct them the mother country watches with a jealous eye ; and Cuba, as long as she remains subject to her, will have cause to mourn over the ignorance of her indigent classes.”

There is an opera-house generally well filled. The Tacon Theatre is said to be larger than the Scala of Milan. Havana has also musical societies ; the three principal of which are, the Filoharmonico, Habanero, the F. St. Cecilia, and the most exclusive, named simply the Filoharmonico.

The Royal Lottery was established in 1812 ; the tickets are drawn in Havana sixteen times in the year ; the prizes amount each of fifteen times to 110,000 dollars, and once to 180,000 dollars. The price of the tickets is four dollars, and so numerous are its agents that almost every small town has one, and pedlars hawk them about the streets and through the country, where many are bought by the slaves.

“ One has but to glance at this mammoth establishment and trace out its multiplied ramifications through the whole island, to perceive the incalculable injury it does to the morals of the people by fostering a spirit of gambling, the very counterpart to one of honest industry. Its very stability and just payment of drawn prizes only increase its baleful influence, tempting more to venture their gains in its vortex. The parental affection of a government, that thus creates a fund by fostering the vices of the people, should be strongly distrusted.”

There are 363 licentiates and doctors of law in the Havana, and eleven ecclesiastical advocates ; besides *escribanos* and *procuradores publicos*, notaries, and attorneys. It has also eighty-five medico-chirurgeons, twenty physicians, ninety surgeons, and fifty-seven sub-surgeons, who, in urgent cases, are permitted to render assistance to the wounded, or sick, until a surgeon or physician can be brought. A large number of barbers, eighty-eight, which receive licences to bleed, cup, leech, apply blisters and setons, and extract teeth, and are generally employed for these purposes by the higher branches of the profession.

There were, in 1842, 140 merchants in the city.

"It is true that the enormous duties compelled some of them to adopt a certain mode of business with the custom-house, with the officers of which they held a tacit understanding. Recent measures have, however, almost completely checked this mode of introducing goods, and although the revenue of the crown has thereby increased, it will only be the means of encouraging smuggling."

Cuba has not a single bank, the merchant drawing on his foreign credit. But although it has only a *specie* currency, in no country is there, in the form of bonds, promissory notes, &c., more paper money.

The Casa Real de Beneficencia was founded, or rather removed, to the present site, in 1794. The departments for the reception of insane females consist of a number of rooms, in front of which a wide piazza extends, and a spacious yard affords ample space for exercise. About sixty-five were lodged here in 1842, of whom not more than a dozen were whites, the rest being of every shade from black to brown. All their necessary wants are supplied.

There is an orphan boys' department, with dormitories in long, high, ventilated, clean halls, in one corner of which the cots used at night are placed away. A dining-room is attached and well provided for about 150 boys, who are also taught in a school. There is also an infirmary attached to this praiseworthy institution.

About 150 girls are also provided and taught in reading, writing, and needle-work.

The institution was at first intended only for girls, and by its rules three years' residence within its walls entitles each on her marriage to a dowry of 500 dollars.

"The children, who are all whites, are received after the age of six years from the Foundling Hospital and other sources. The boys are kept until fifteen years old, and are then indentured as apprentices. In 1842, a proposition was made by Monsieur Antonio Cournand, a student of the high normal school of Paris, and tutor in this institution, to educate the more intelligent boys for schoolmasters, to supply the schools on the island. It was agreed to by the trustees of the school, but the early death of the proposer has unhappily frustrated the completion of the design."

In addition to the departments already described, the institution embraces also one for white female paupers, another for the free coloured, and one for indigent men. The Lunatic Asylum is also a part of it.

"It contains besides, a place for the confinement of slaves arrested for crimes, from which it receives a considerable income, in the charges exacted from their owners for their lodging and board."

The capital of the Casa de Beneficencia amounted in 1832 to 262,505 dollars, and by the report for the year 1842, read by its secretary before the Patriotic Society, its income for that year was 86,407 dollars, and its expenses 86,262 dollars. Of this sum 3300 dollars were for six doweries, and an additional one bestowed during that year. In the girls' department twenty-two had been admitted, twenty had been placed at service in private families, two had married, and two had died. In that of the boys' thirty-three had entered, thirty had returned to their friends, or had been indented, and one had died; 156 were left, and of the girls 151. In the Lunatic Asylum, fifty-four had entered, twenty-eight had left, and eleven had died, leaving 130; while in the female insane department, nineteen had entered, twelve had left, and seven had died, leaving sixty-three. Of the paupers, thirty-two had entered, twenty-six had left, and seven had died, leaving thirty-nine. The whole establishment gives shelter to 604 individuals, including forty-nine negroes of both sexes, and sixteen slaves belonging to it.

Another charitable institution, the Hospital of San Lazaro, destined chiefly to succour those unfortunate persons affected with the incurable *Kocubea*, or *Lazarino*, commonly called leprosy, a disease said to be peculiar to the West Indies. It commences its ravages on the toes and fingers, which first become atrophied and distorted; then a small blister appears on their extremities, and joint after joint decays and falls off, until sometimes the whole hand to the wrist, and the whole foot to the instep is wasted. Some recover with the loss only of the first and second joints of their fingers or toes; but the stumps remain insensible.

"This disease is probably ossification of the arteries, on which an inflammation supervenes, closing their calibers, and death of the part ensues, as in senile gangrene. It is regarded by the Creoles as contagious; and any one affected by it, if seen in the streets, is at once conveyed to the hospital. No instance has, however, been related of its spreading there to the nurses or physicians; and I have myself known the father of six children, who although long a martyr to this affection, never communicated it to them or his wife, although they visited him constantly in the cottage where he lived, separated from the other negroes, on a coffee plantation."—*Notes on Cuba*.

The road leading to the Campo Santos, or common cemetery, is through mean streets, but the entrance to it is through a pretty shrubbery of roses, pomegranates, papayos, &c., rills of water meandering through it. Palms rise in rows within, where negroes are perpetually digging graves. Near it stands a lunatic asylum.

The Military Hospital lately established in the building which was formerly the Royal Factory of tobacco, is an immense quadrangular building, enclosing several separate squares, and presenting the appearance of a large fortress, with massive high walls, well secured by gates. It was in these vast buildings that all the cigars of Cuba were made, and the tobacco packed for exportation, when the trade in that article was monopolised by a chartered company. Its capital was

1,000,000 dollars, and in less than fourteen years the property of the company amounted to 14,000,000 dollars; and the expense of boxes, superintendence, and labour, amounted annually to 46,000 dollars. All the employés and labourers, to prevent their smuggling, were compelled to live within the building.*

As a military hospital its arrangements are highly extolled by the American physician. It contained in January, 1842, 480 patients, and received that year 5622. Of these 5540 left it cured, 201 died, leaving 358 in its wards in January, 1843.

The comparative mortality of Havana may in a measure be learned from the statistics of its hospitals. San Juan de Dios, in 1842, lost 507 of 2299 who entered; San Francisco de Paula, for women, 181 of 479; San Lazaro, 18 of 106; the foundling hospital, Real Casa de Maternidad, 32 of 169; the military hospital, just described, 204 of 6102; in all, 942 of 9155—about 9.7 of the patients entered.

Of the monastic institutions, &c., that have been suppressed, Antonio de Lopez states that in his time there were twenty-three convents in Cuba, three of them contained nuns.†

Of the hospitals established by the religious orders, San Juan de Dios is the most ancient, having been founded by three brothers, hospitallers from Cadiz, in 1603. During the seventeenth century, according to its tables, it had 100 beds, and 800 sick persons were annually cured in it; but as the commerce and population of the city increased, it is probable that the number was greatly augmented; the order consisted of thirty brothers.

The hospital San Francisco de Paula, dedicated to the reception of women, was founded in 1665 by Don Nicolas Estébes Borges, a native of Havana, and dean of the church of Cuba. In 1730 it was destroyed by a hurricane, and was rebuilt in 1745.

La Cuna, the Cradle, was founded in 1711, at an expense of 16,000 dollars, and maintains both the nurses and the foundlings. In 1842 it received sixty-four children, in addition to the 105 remaining from the last year; of these, thirty-

* Arrate.

† Sebastian de la Cruz, one of the few saved from the wreck of the ship *Perla*. Covered with rags he entered the city, exciting by his actions the laughter and mockery of the mob, which at first treated him as a lunatic. But his obstinate silence, the imperturbable quiet and humility he manifested under their injuries, and especially the perseverance and courage with which he castigated himself, resting nightly on thorns, and rising covered with wounds, induced a more favourable opinion of his merits.

Soon after his entrance in the city, he appeared in public, dressed in the third order of St. Francisco, and went about exercising charity to all the sick he met, whom he conducted to his barracon. There he cured them, administering with great benevolence all the aid he could, to which end he applied the alms he received; and was at the same time their cook, their nurse, and their almoner. Thus did this singular man spend the remainder of his life, which terminated on the 17th of May, 1589, without informing any one who he was, or whence he came, on which subjects he ever preserved an obstinate silence. The account of his life is found in both Valdes' and Arrate's histories of Cuba, but the latter fixes the period of his death in 1778—so much do historians differ.

two died, twenty-three were sent out to gratuitous nursing, and two to the Casa Beneficencia, leaving 112 inmates: its income was 35,859 dollars, and its expenses 31,682 dollars. The name of its founder is conferred on all infants left without one under its protection. There are beside eighteen other public hospitals on the island, located in its chief towns.

Education.—No report on the state of education in the whole island has been made to the Sociedad Economica since that of 1836, by Don Pedro Maria Romay, and Don Domingo del Monte. According to that report, the island contained 41,416 boys, from five to fifteen years of age, and 32,660 girls, from twelve to fourteen. Havana maintained eighty-five white and six coloured male schools, in which 4453 white and 307 coloured boys were educated; and fifty-five white and one coloured female schools, with 1840 white and thirty-four coloured girls.

The second division of the island, St. Jago de Cuba, had thirty-two white and nineteen coloured male schools, and educated 1069 white boys; and nineteen white and five coloured female schools, with 347 white and 145 coloured girls. Puerto-Principe, the third division, had twelve white male schools, with 512 white boys; and seven female schools, with 239 girls, not classified. The whole amounting to 210 schools, with 8460 white scholars; and thirty-one schools, with 486 coloured scholars. Of these, 3678 received a gratuitous education; 1243 from the teachers themselves, and 2435 from funds provided by the Sociedad Economica and by subscriptions, &c.*

The report of 1842 states that the public funds for the gratuitous education of scholars, which not long before amounted to more than 32,000 dollars, has been reduced to 8000 dollars, sufficient to support only 457 boys, and 342 girls, in thirty-seven schools. The cost of instructing them in religion, reading, writing, arithmetic, and grammar, was, for each pupil, one dollar monthly. In the large towns schools are general, but in the country districts scarcely any are provided with even primary schools. Nueva Filipina, with a population of more than 30,000, and containing the richest vegas of tobacco, has but one school for about forty boys, recently established.

The poverty of the labouring whites in the rural districts is one cause of this neglect of education; the children often have no clothes decent enough to appear at school, and some have none at all. But the high and oppressive taxes to meet, no one dares publicly own, is the depressing effect. The enormous exactions of Spain, the mother country, is the principal curse.

Crime.—No statistics of crime have ever been officially published: the following report affords some data by which the aggregate may be roughly calculated. Of the number of criminals, however, confined in the Havana prison in 1842, many are brought from a distance, and includes all within the jurisdiction

* *Memorias de la Sociedad Economica*, Vol. ii., p. 220—370. The report, written by Senor Del Monte was too liberal in its tone to be printed entire.

of the capital, a population of 631,760; the greater number from the ignorant population of the country.

ACCUSED OF	Whites.	Coloured.	TOTAL.
	number.	number.	number.

Suspected of various transgressions.....	192	191	383
Minor offences.....	108	64	172
Sent to the prisons of other jurisdictions.....	45	62	107
Total.....	1123	1219	2434

From this number must be deducted 107 sent to the prisons of the jurisdictions where the crimes were committed; also the convict deserters and the soldiers, 71. Of the 383 suspected persons, it is calculated that 283 at least will be found innocent, for persons in Cuba are often imprisoned on very slight grounds of suspicion. The 462 arrested for non-observance of police laws, cannot be classed among criminals, and, added to the preceding, make the number 928 to be deducted from the total, leaving 1506 criminals.

The same year 19 lunatics were confined in the prison until proved fit subjects for the Lunatic Asylum, making the total 2451; that for 1841 was 2551, at the end of which year 482 remained confined; and at the end of 1842, only 287, showing a decrease in crime. The comparative number of particular crimes in the two years, were as follows:—

ACCUSED OF	1841	1842	Diminution.

The following is a comparative statistic of crime and education, reported in 1837 to the Patriotic Society by the captain-general. Of 888 prisoners in the Cabanas, 494, charged with grievous offences, had not had even a primary education: to which may be added, 239 sick prisoners sent to the hospital San Juan de Dios, making the total 1127 persons accused of crime. The 4407 scholars in Havana and its suburbs, compared to the accused, give a percentage of 26, and to the 1105 convicted in the capitania-general, give 25 per cent. The same comparison between the scholars and prisoners, gave for Cuba (St. Jago) 24 per cent, Baracoa 28 per cent, Jiguani 21 per cent, Bayamo 5 per

cent, and for San Juan de los Remedios 20 per cent. The greater number of the prisoners in these places had not received even a primary education.*

Intoxication is very rare. With all the corruption of the bench, the murderer seldom escapes from punishment; and even the duellist receives no mercy, which crime is now said to be *unknown* on the island.

The *section of Industry and Commerce* has reported to the *Sociedad Economica* on the subject of apprenticeship, for 1842, that they have reclaimed from vagrancy 1411 boys, and placed them in situations to learn trades and the arts; of these, 257 were apprenticed in 1842. During the year this section also adjusted 620 quarrels between the masters and the apprentices, and their parents or trustees; so satisfactory were their decisions, that only five disputes were referred to a magistrate. Of the whole number apprenticed, seventy-two became masters of their trades; eighty-four changed masters by mutual consent; eleven died; 159 absconded, 153 of whom were retaken and replaced in their occupations. Fifty only were lost, many of these having been removed by their own parents or trustees; fourteen were sent to the workshops of the Lanceros as a punishment; and thirty-two were arrested for public offences.

The author of the "Notes on Cuba," describes the views from the Cabanas as truly magnificent. He says,—

"Far down lies a forests of masts, the tops of which are hardly on a level with the base of the fortress; and just beyond is the populous city, with its solid blocks of turretted houses occupying every space of the level land, and creeping half-way up its surrounding hills. Carry your eye southward, and trace the shores of the little bay everywhere studded with villas, its bosom covered by the large fleet of vessels from every nation, riding securely at anchor; and the summits of the adjacent heights crowned by forts, protecting while perfectly commanding the city—presenting, in their sullen grandeur, a strong contrast to the peaceful look of the latter. How dwindled to pigmies are the moving throngs below, yet how the sound of their mingled voices sweeps upwards; even here you can almost distinguish the words spoken. And that sudden burst of music from those numerous convent bells, playing their merry tunes, as if to arouse the buried monks once more to life's joys. Now they cease—and now again they all strike up a din, that would start a fireman from the sleep of death.

"But let us leave this spot, and following the parapet, separated from the fortress itself by a deep fosse, trace all its indentations and angles. What a city of embattlements lies on your left, as you pass sea-ward! line upon line, and battery over battery, all admirably supporting each other, and the whole on such a grand scale, that the place seems built to be garrisoned by giants. The very air of desertion which its long extent of unarmed embattlements presents, adds to its apparent strength: the largest cannon, in those embrasures, would look like a swivel on the deck of a line-of-battle ship; a thousand soldiers paraded on those stupendous works, would only impress the beholder with an idea of their weakness. Not a single human being is seen on its walls; its sentry-towers, hanging over the abyss below, are tenantless, and silence seems to hold her court within the massive enclosures. Suddenly, the roll of the rattling drum issues from its inner depths, and the trumpet speeds the message in repeated wild notes to the next fortress. It is the signal of the setting sun, and from battery and fort, and the war-ship's deck, is heard the evening gun; but the sudden tumult is over, the mingled

* *Memoris de la Sociedad Economica*

noise from trumpet and drum have ceased, and the spirit of the place seems again to slumber.

"We have now followed the parapet nearly a half mile; and beyond lies another fortress, the Moro, with its tall tower, its 'Twelve Apostles,' and its 'Pastor,' ranging the surface of the water, and completely commanding the entrance of the harbour, itself an almost impregnable stronghold; while to our right, within a mile, another height is covered by batteries that could sweep the whole intervening vale. Well might the palm of building be awarded to the Spaniards, but let us not forget that that of *keeping* has been conceded to the English, and let us profit by the history of Gibraltar. With a sufficient number of troops—a Spanish officer has said 8000—the Cabanas would be impregnable; and should this port ever again fall into the hands of the English, our whole southern coast and the Gulf of Mexico would be commanded by them, nor could any present power dispossess them of it by force."

In the arsenal of the Havana there have been built forty-nine ships of the line, twenty-two frigates, seven packet-ships, nine brigs of war, and fourteen schooners of war.

The suburbs, or *barrios extra muros*, cover more ground, and contain a larger population than the city within. The line of fortifications embraces a sort of irregular polygon, of an elliptical form, the greater diameter of which is 2100 yards, and the smaller 1200 yards in extent.

HARBOUR OF HAVANA.

The harbour, topographically, assumes the form of a capacious basin, with a narrow entrance. The entrance between the Moro and Punta Castles, is about 1500 yards long, and in its narrowest part 350 yards wide; and the harbour is said to be one of the safest and most strongly defended in the world.

The depth of water at the entrance is about eight fathoms; the rise and fall of tide nearly two feet. There is no bar or other impediment at the mouth, with the exception of a rock under the Moro Castle, close to the shore, on which there is five fathoms water, a flat rocky shoal extending about forty feet from the water battery. The length of this shoal from the inside of the Moro point is about sixty feet. At the time of the taking of the Havana by Peacock, several vessels were sunk in the entrance, about forty-five yards from the Moro; and their position is still marked by buoys moored over them. On the opposite side a buoy is moored to mark the Telino bank, about forty-five yards from the Punta Castle. No chart of the harbour has ever been published with the sanction of the government.

The wharves at which ships discharge their cargoes are not extensive. Ships lie, while discharging, with their stems or sterns to the shore; and thirty or more ships of the largest class, and an equal number of coasters, have frequently lain alongside each other. There is ample space for the extension of wharves. Casa Blanca is on the opposite side of the harbour: where the slavers who frequent the Havana have wharves, and ship-yards, in which vessels of all classes are fitted out, or repaired, and there is space sufficient for several hundred vessels to ride at anchor in front of the wharves.

On the south side of the entrance of the Havana there is a lighthouse, with reflecting lamps and a revolving light, which may be seen twenty-five miles distant.

The harbour can be known at a distance at sea by the hills of Managua, which lie inland south from the entrance; eastward as well as westward the land is low, with the exception of the Moro rock, with its lighthouse and fortifications. Six leagues to the eastward are the detached hills of Jaruco, of moderate height. Dolphin Hill is seen some four leagues more westerly.

The harbour is not very easily entered when the wind is north, or east-north-east, as the channel lies nearly south-east and north-west. The wind begins to blow about ten in the morning, and continues till sunset, which enables vessels to enter the port during the day. In the rainy season the winds are often unfavourable for entering: vessels at this time anchor on the Moro bank and warp in.

In the dry season, or when the *nortes* blow, there is some difficulty to put to sea, from the swell which sets in to the harbour's mouth. Generally vessels enter about noon, and depart about sunrise, excepting in the hurricane months, and later in the season when the *nortes* prevail. The anchorage on the Moro bank is tolerably safe. But there are so few dangers, that with ordinary care, there is but little risk either in entering or departing from this admirable harbour.

CHAPTER XIV.

RECENT CUSTOMS' REGULATIONS.—TRADE OF THE PORT OF HAVANA IN 1844.

The alterations in the new *pauta*, in 1846, are favourable to Spanish tonnage, and consequently go still more to the exclusion of British shipping from the import and export trade; although, in general, they do not materially affect the *consumption* of British staple-manufactures, as the duties augmented on some articles are reduced on others.

The duties on linens have been somewhat reduced, whilst those on cottons are increased, and some changes have been made in the classification.

The export duties also have been changed, and the tonnage duty on vessels carrying away molasses is now exacted; all foreign vessels, by an order just promulgated, are subjected to the payment of twenty-three per cent additional tonnage duty, as difference between their registered tonnage and the Spanish ton of Burgos, or abide by the measurement to be made here.

CONTRAST of Export Duties.

	By Foreign Ships to Foreign Ports.	By Spanish Ships to Foreign Ports.
Sugar, formerly . . .	50 cents per box . . .	37 cents per box.
„ now . . .	37 „ „ . . .	25 „ „
Coffee, formerly . . .	56 $\frac{1}{4}$ „ per 9lbs. . .	50 „ per 9lbs.
„ now . . .	20 „ „ . . .	12 „ „
Tobacco, formerly . . .	161 „ „ . . .	85 „ „
„ now . . .	150 „ „ . . .	75 „ „
Cigars, formerly . . .	62 $\frac{1}{2}$ „ per mil } any flag.	
„ now . . .	50 „ „ }	
Rum and molasses remain free of duty.		
Copper ore to pay nine cents per quintal.		

A fixed rate of duty on flour imported continues to be charged as follows :—

2 dollars 00 cents per barrel, Spanish growth, by Spanish ships.
6 „ 06 „ „ „ „ by Foreign „
8 „ 58 „ „ „ „ by Spanish „
9 „ 95 „ „ „ „ by Foreign „

Rice.....	{ Spanish, in Spanish ships, 3 $\frac{1}{2}$ p. ct.	Spanish, in foreign ships, 17 $\frac{1}{2}$ p. ct.
	{ Foreign, in „ 23 $\frac{1}{2}$ „	Foreign, in „ 33 $\frac{1}{2}$ „

By royal order from Spain, instead of the rate of two dollars paid by each vessel entering the ports of Havana for the health visit; foreign ships are now subjected to the payment of one-third of a real for each ton of their measurement; *i. e.* a vessel of 300 tons has to pay twelve dollars four rials, whilst Spanish vessels are now subjected to only one-half of the above charge, or half a rial per ton; being upon 300 tons, six dollars two rials.

NAVIGATION OF THE PORT OF HAVANA, DURING THE YEAR 1844.

In 1844, there arrived at Havana, 67 British vessels, of 12,659 tons, 715 crew; with cargoes, value 63,312*l.* 9*s.* 8*d.*: and 65 vessels, of 12,491 tons, and 701 crew, departed; with cargoes, value 135,531*l.* 15*s.* 8*d.* Also, 516 Spanish vessels, of 71,985 tons; 851 American, of 160,102 tons; 24 Bremen, of 4353 tons; 16 Belgian, of 4418 tons; 21 Dutch, of 4053 tons; 22 Danish, of 4196 tons; 26 French, of 5738 tons; 17 Hamburg, of 3796 tons; 1 Knipphausen, of 322 tons; 5 Mexican, of 409 tons; 10 Prussian, of 2967 tons; 8 Russian, of 2975 tons; 8 Swedish, of 2293 tons; 2 Sardinian, of 435 tons; 2 Oldenburg, of 250 tons; 2 Norwegian, of 710 tons; and 2 Brazilian, of 437 tons:—making altogether, 1600 vessels, of 282,698 tons burthen.

In 1844, there arrived at the port of Havana, 49 British steam-packets, bringing 568 passengers, quicksilver, cochineal, gum copal, &c.; total value, 6,710,280 dollars. These vessels departed with 782 passengers.

CHAPTER XV.

OUT-PORTS AND TOWNS—PORT OF MATANZAS—PUERTO PRINCIPE.

THE city of Matanzas, which ranks next to Havana, as a commercial port, was previously to 1809 prohibited to trade to any foreign country, and restricted in its trade in many other respects, though forming an outlet for the products of the richest part of Cuba. It lies on the north coast, fifty-two miles east of Havana. Its harbour, which is rather limited in anchorage ground, by the mud brought down by two rivers, is sheltered by a ledge of rocks.

The bay, which is spacious, is protected from all winds but the north-east.

There are two channels, the one in at the north, the other in at the south, end of the ledge; but the southern is only deep enough for coasting vessels.

The most recent account which we have of Matanzas is by the intelligent author of "Notes on Cuba." He visited the place by land, and observes,—

"The country, after leaving the Carlotta and its beautiful valley, became rolling, and more sterile the nearer it was to the coast. It was only when we reached the San Juan River, which runs by Matanzas, that it became again clothed in the rich verdure of cultivation. Its borders were lined by farms, and on its occasional meadow lands, herds of cattle and troops of horses were grazing on the luxuriant herbage. About a league from the city we passed the only refinery of sugar established on the island, and that one owned by an American citizen. Its sugars have been proved, by a comparison, to be superior to the best in the states, preserving, in a measure, the flavour of the cane; still, in Cuba, the clayed article is preferred for its cheapness, the coffee and chocolate, here almost universally drank, masking its peculiar flavour. A market has, however, been opened for it in Spain, which will remunerate the proprietor for his enterprise and outlay.

"The outskirts of the town were composed of mean-looking, straggling, and often, deserted houses, very pictures of desolation and misery, with here and there a *tienda*, before the door of which was generally seen a number of pack-horses waiting for their driver, who was regaling himself with a glass of water after his dram of undiluted *aguardiente*. There were no gardens nor gentlemen's houses to be seen, although on the neighbouring heights were many beautiful sites; the grounds were sterile, and the sides of the hills covered only with a few stunted bushes and short grass. As we entered the more populous parts of the town the houses improved in appearance, but the greater number by far were of only one story, and presented irregular fronts, without any regard to architectural beauty. Our boarding house, the only one of the two in the city where English was spoken, was soon gained, and so fatigued had we been by our repeated promenades up the hills, that we took possession of our uncomfortable rooms with a great degree of satisfaction. The scene without was one, however, that could not fail to arrest the attention of even way-worn travellers. Close by us was the stone bridge of the Yumuri river, with the varied crowd of armed *monteros*, *volantes*, pack-horses, and ox-carts hurrying into or leaving the city; and beyond the Cumbre, its long extended sides covered with a rich carpet of yellow flowers to its very summit, with here and there a solitary building or clump of trees irregularly disposed on its gentle declivities. On the other side rose the high hill back of the city, with cultivated fields, and palms and cocoas, terminating abruptly at the deep gap separating it from the Cumbre, with thick woods skirting the whole brink of the precipice; and to the east the beautiful bay and its anchored fleet, and forts, and rocky shores. The city, itself, lay on a flat surface, and the first rising grounds of the neighbouring hill, between two small rivers which issued from the islands beyond, and depositing the soil borne down by their currents in the eddy formed just before the city, rendered the water there very shoal, and prevented the near approach of vessels. In consequence of this they are anchored about half a mile from it, and are loaded and unloaded by large launches of light draft.

"The first lines of this city were traced on the 10th of October, 1693, by Señor Manzaneda, under whose government it was founded. To the city itself was given that of San Carlos Alcazar de Matanzas: the last that by which it is generally designated, signifying the slaughter of a battle-field.

"The back country of Matanzas is rich in sugar and coffee estates, and after it was made a port of entry it increased rapidly in size and commerce. It now extends an arm across the San Juan river into the adjacent mangrove swamp, where an embryo city has sprung up, called the Pueblo Nuevo; and over the Yumuri, at the base of the Cumbre, another arm named Versailles. Including these two suburbs, its population in 1841 amounted to 19,124, of whom 10,304 were whites, 3041 were free coloured, and 5779 were slaves. The same year 480 vessels entered its port, of which 302 were American,

and 558 sailed from it ; paying to the government in tonnage and other duties nearly a million of dollars. Its importations amounted to 1,995,311 dollars, of which 434,599 dollars were for lumber from the United States ; and its exportations to 4,374,780 dollars, of which 3,733,879 dollars were for sugar, 351,733 dollars for molasses, and 163,385 dollars for coffee.

"It contains one church (the foundation of which was coeval with that of the city), which is now nearly completed, and another recently erected in Pueblo Nuevo ; a large and excellent hospital ; extensive barracks garrisoned by a regiment of Spanish soldiers, a theatre, and a cock-pit, like every other town in Cuba, and, for the benefit of my countrywomen I mention it—a solitary mantua-maker and milliner's establishment. Its public library, which in 1835, contained 695 volumes, now possesses over 1000, and reports made on it state the gratifying fact that it was daily more resorted to. In 1827 an adjunct society to the *Sociedad Económica* of Havana was established here, and now numbers nearly one hundred resident members ; it is divided into two principal sections, one on Education, the other on Industry and Commerce, the labours of which have been highly instrumental in sustaining their respective objects. The jurisdiction of Matanzas in 1835 contained 4460 children of both sexes, of whom only 815 received a primary education, and of these but 360 in public free schools ; the whole number of schools amounted to sixteen. The recent reports of its section on education have, however, given a more favourable view of this subject ; although it must be confessed, that learning is here, even now, at a lower state than in almost any other civilised country.

"The houses of Matanzas are mostly of stone, built like those of Havana in a very durable manner, with their windows as strongly barricadoed with iron bars. But the number constructed of wood, the English one continually hears along the Bay-street, and the general cleanliness of the town, give to it somewhat of a home air. It wants the bustle of Havana, nor has it as many sources of amusements ; but to many its very quiet forms an attraction, and the proximity of its beautiful *passéo*, from which a fine view of its whole bay is obtained, its purer air, and the romantic scenery in its vicinity, induce many to prefer it as a residence.

"The manners here are similar to those of Havana ; the mornings are devoted to business, and in the evening those who have volantes and horses ride on the *passéo*, while the promenaders amuse themselves in gazing at the ladies. I must not omit to mention that at this time the merchants and sea-captains meet on the Bay-street, the Americans in front of a store owned by one of our countrymen, which from time immemorial has formed a kind of exchange for them. The billiard-rooms, of which there are several large ones near by, are then also crowded, chiefly by Spaniards and Creoles, who spend a large part of their idle hours at this game. Music parties are common ; social visitings are also kept up, it is conceded by all who have visited the two cities, that the fair of Matanzas bear the palm for beauty. The plaza is also a favourite resort at night, especially when the military band is present ; but here, as in Havana, the female form is rarely seen in the streets except in a volante, or at night. The Sunday morning is spent by but a very small proportion of the population in public worship ; shops are kept open all day, and only the closing of the custom-house, the police, and other public offices, and the cessation of labour in loading the shipping, distinguish it from other days. The afternoon is especially devoted by the negroes to amusements, and in numerous places on the hill back of the town, and in the Pueblo Nuevo, will be seen flags raised on high staffs. These point out the spots where they congregate and indulge in their national dances, for the different tribes introduced here from Africa retain all their custom and habit."

To the music of two or three rude drums, formed by stretching an untanned cow-hide over the extremity of a hollow trunk of a tree, the crowd of men and women, gaudily dressed, keep time with their hands. These balls are all under the protection of the civil authorities, who permit them to take place only on Sundays and other religious holidays ; they are never frequented by even the

lower classes of whites, and good order generally prevails among their sable performers. Over each slave tribe a king and queen presides, and so great is the influence exercised by the former over his subjects, that complaints made to him of the idle or vicious habits of any particular individual, not unfrequently, through his remonstrances, correct the evil.

Trade of Matanzas.—The importations are chiefly articles of food, and materials and machinery for sugar and coffee estates; most of its fancy and other goods are brought from Havana. During the last piracies in the Caribbean sea and the Gulf of Mexico, not a small portion of the spoils obtained by murder and robbery on the ocean, found their way, overland from Cardenas and other places, to this city, where purchasers were readily found; and smuggling was carried on extensively here. At present, the custom-house regulations are strict, and piracy is now unknown. The principal business mart is a long wharf projecting into the bay, covered by a shed.

There were, in 1844, forty-eight commercial houses in Matanzas, including several American, English, German, and French. Much of the products of the country is sold in the city, but a considerable portion is shipped for disposal in foreign ports. The counting-rooms are all in the dwelling-houses of the merchants, and as there are no banks in Cuba, each contains an iron safety-chest for specie; attached to the dwellings are store-houses for sugar, coffee, &c. The merchant and his clerks generally live under the same roof and dine at the same table.

Matanzas has eighteen physicians and surgeons, thirteen apothecaries, and several barbers, for the preservation of the public health; the last do all the bleeding, cupping, and leeching prescribed by physicians, and undergo examinations, before licences to practice this minor surgery are granted to them. There is but one cemetery for all who die in the city and its suburbs. The public peace is intrusted to thirty-four advocates, eleven notaries and seventeen attorneys. Matanzas is twenty-two leagues east of Havana, in latitude 23 deg. 2 min. 45 sec. north, and longitude 75 deg. 15 min. 42 sec. west of Cadiz. It is the seat of a governor, and includes within its jurisdiction a circuit of about six leagues. Within this space are 161 sugar estates, employing 29,696 persons 175 coffee estates, with 13,332 persons; and 1881 farms and other rural establishments, with 20,942 persons. The whole population amounts to about 85,050, of which 27,148 are whites, 4570 free coloured, and 53,322 slaves; only 21,070 of the whole reside in cities and villages.

There are several beautiful drives in the vicinity of Matanzas. The neighbouring valley of the Yumuri is splendid, with its back-grounds broken into sharp peaks, or now gently undulating;—

“ Its cane-fields with their pea-green verdure, and the dark-green foliage of the

tall palms scattered irregularly over them ; its golden orange-groves and luxuriant plantains, with broad waving leaves ; its cocoas, its almonds, and its coffee, with here and there a gigantic Ceyba spreading out its massive arms high in air. As the mist, which in different parts hung over the scene, rose in fleecy masses, or gradually dissolved in the increasing heat of the day, and farm after farm, and cottage after cottage became lit by the bright sun's rays, throwing into the bold relief the illuminated portions, while the rest still lay in the deep shade of the Cumbre, a landscape was presented, that I had never seen rivalled even amid the picturesque scenery of Switzerland."

It was here that, in 1511, numbers of the aborigines were cruelly massacred by the Spaniards ; and the remnant, driven by bloodhounds to the surrounding heights, were forced in despair to throw themselves over their brinks into the river below, crying out, "*Io mori*," I die ; whence the name of the vale and river.

"On the ridge were several private residences, into one of which we were invited by its owner, who gave us that scarce article on a Cuba farm, a glass of fresh milk. In our descent to the city several varied and beautiful views of it, and of the harbour and shipping, were presented ; and when we reached the base of the hill, a short but rapid drive brought us into the gap through which the Yumuri escapes from the valley. High precipices rose on each side, their summits crowned with luxuriant growths ; while from the overhanging walls of the southern side immense stalactites of various hues hung in irregular and grand festoons, amid which the entrance to a large cave was plainly visible."—*Notes on Cuba.*

Puerto Príncipe.—The city of Santa Maria de Puerto Principe, is the capital of the central department of Cuba. It is situated in the interior. Mr. Turnbull says, "it stands between two rivulets, the Tinima and the Satibonico, which afterwards unite, and form the Rio de San Pedro, falling into the sea at the distance of forty miles in the direction of east-south-east. The trade of the place, as may be supposed from its inland position and its want of water carriage, bears no just proportion to the number of its inhabitants. In former times the *Hatos*, *Corrals*, *Realengos*, and *Potreros* in its neighbourhood, were the chief source from whence the capital of the island obtained its supplies of butcher's meat. At that remote period it was not uncommon for 20,000 calves to be sent in the course of a year from Puerto Principe to the Havana ; but the soil in the neighbourhood of the capital having been long ago exhausted for agricultural purposes, by a bad system of husbandry, and the sugar estates, which formerly existed there, having been definitively abandoned, the land has been laid down in pasture, and the markets of the Havana have thus become to a certain extent independent of more distant supplies.

"It was formerly the practice, when grants of land were obtained from the government, to fix upon a point which was to be declared the centre of a circle, the circumference of which was to become the limit of the concession. This method was probably resorted to for the purpose of avoiding disputes as to territorial boundaries ; but in the sequel it had only the effect of making these questions of boundary more intricate and more difficult of adjustment.

"The *Hato* was a circle, the diameter of which was four leagues ; that of the *Corral* being equal only to its radius—that is two leagues in extent ; the *Realengos* were the royal reserves, surrounded by the exterior curved lines of the *Corrals* and *Hatos*, to which the original name continued to be applied long after the land had been ceded to private individuals ; and the *Potrero* was a portion of land indeterminate in form or extent, but generally occupied, like the *Hatos*, *Corrals*, and *Realengos*, as breeding farms for the rearing of cattle.

"The *Haciendo Principal* is a generic name, including all but the *Potrero*, and is applied to breeding farms of the largest class ; while the *Potrero*, without any definite limit, is considered a place of inferior importance. In the course of time the curved boundaries of the *Hato*, the *Corral*, and the *Realengo*, have been gradually departed from, by the ordinary exercise of proprietary rights, by sale, deed of gift, or testamentary disposition ; as by another mode of exercising these rights, the original cattle-pen, as the breeding farms are called in Jamaica, has been converted into *Ingenios* or *Cafetals*, or otherwise applied to agricultural purposes. The dimensions of the *Hato* being so much greater than those of the *Corral*, the latter was formerly confined to the raising of pigs, goats, and sheep ; while on the *Hato* were bred the horse, the mule, and the cow ; but this distinction, like that of the form of the estate, is also becoming obsolete.

"The Bay of Nuevitas may be regarded as the harbour of Puerto Principe, although twelve leagues and a half distant, as there its produce is shipped, and and from thence it receives its foreign supplies. The want of all tolerable means of communication, however, for the carriage of heavy articles, is such as to threaten the greater part of the rich soils of the interior with a condemnation to perpetual virginity.

"A few years ago a new colony was formed in the Bay of Nuevitas, which at the end of twelve years from its commencement, could boast of a growing population, already amounting to 1153 ; of whom 709 were white, eighty-seven free people of colour, and 357 slaves."

Puerto Principe is 151 leagues from Havana, has a population of 13,817 whites, 5784 free coloured, and 4433 slaves. Formerly the number of inhabitants was much greater. It was founded by Velasquez on the port named by Columbus del Principe, now Neuvitas ; but was afterwards removed to Camagüey, a pueblo of Indians, on account of the frequent invasions of the pirates.

Trade.—Its importations in 1841 were in value 186,825 dollars, of which 117,340 dollars were for provisions, and 10,000 dollars for lumber ; its exportations amounted to 74,595 dollars, of which 24,264 dollars were for sugar, and 11,000 dollars for tobacco ; forty-nine vessels entered its ports, of which seventeen were American, and it received in duties, &c., 51,935 dollars.

The jurisdiction of the city, which is the seat of a lieutenant-governor, extends over a population of 51,086. Of this 3010 are on ninety-one sugar estates, forty-seven on one coffee estate, and 20,091 on 2201 farms; the rest being included in the town and villages. The whites number 30,104, the free coloured 7599, and the slaves 13,383.

TRINIDAD, another of the seven cities founded by Velasquez, is situated a league from Port Casilda, on the south coast, and ninety from Havana. It is the seat of a governor, and contains 5877 whites, 4474 free coloured, and 2417 slaves. Its importations in 1841, amounted in value to 942,661 dollars of which 469,243 dollars were for provisions, and 170,090 dollars for lumber; its exportations to 1,157,571 dollars, of which 934,565 dollars were for sugar, and 138,534 dollars for molasses; 203 vessels entered its port, of which 116 were American, and it received in duties, &c., 351,559 dollars. It has jurisdiction over a population of 28,060, of which 7004 are on forty-four sugar estates, 905 on twenty-four coffee estates, and 1611 on 826 farms: the rest being in the towns and villages. The whites number 10,280, the free coloured 6092, and the slaves 11,688.

The southern coast has twenty-eight harbours and roadsteads, of which that of St. Jago de Cuba is one of the best in the world, and is protected by a *moro* and several batteries. The large Bay of Guatanamo has several harbours, and that of Jagua has a secure port, and is fortified; the latter has six square leagues of superficies. The Bays of Cortes and of Corrientes admit large vessels.

From the Cape de Maisi to the Cape de Cruz on the south coast; and from Bahia-honda to the Punta de Icacos on the north coast, the island is easy of access, and the coast-navigation excellent. The rest of its coasts is lined by reefs and islands, within which steamboat navigation is safe at all times of the year. The islands off the coast vary in size, from a few yards to several miles. One of them, the Cayo de Sal, supplies Havana with salt; others, like the Cayo de Vela, have good anchorage; while some are so surrounded by reefs, as to be almost inaccessible.

The Isle of Pines, *Isla de Pinos*, formerly so celebrated as a hiding-place for pirates, is on the south coast. It has 117 leagues of superficies, but is divided longitudinally by an extensive swamp, passable at only one point. The population is about 500, and has lately been put under a military and civil government. Its chief pueblo is Nuevo Gerona, on the west bank of the River Casas; the other is the pueblo of Santa Fé, on the river of the same name; it is watered by another river, the Nuevas. Its mountains are the Canadas, Daguilla, Sierra de Casas, and Caballos. The Bay of Siguanea is on the west coast, and terminates south-west at the Cape Frances—but a small part of this island is cultivated.

SANCTI SPIRITUS, founded by Velasquez, 100 leagues from Havana, is remarkable for the great majority of its white over the black population. The town itself contains 5296 white, 2722 free coloured, and 1466 slaves; its jurisdiction extends over 32,711 persons, of which 2258 are on forty sugar estates, 109 on three coffee estates, and 20,069 on 2668 farms. The whites number 21,969, the free coloured 4958, and the slaves 6784.

SANTIAGO DE CUBA, more frequently called Cuba, was founded by Velasquez. It is the capital of the eastern department of the island, and the seat of an archbishopric: and situated in 20 deg. 1 min. north latitude, and 76 deg. 3 min. 30 sec. west longitude. Its harbour is safe and commodious: the sea breeze generally blows into the harbour during the day, and the land wind blows out during the night.

It is 230 leagues from Havana, on the south coast. It is the seat of a governor, and contains 9326 whites, 7494 free coloured, and 7933 slaves. Its importations, in 1841, amounted to 2,631,421 dollars, of which 1,305,685 dollars were for provisions, 57,821 dollars for lumber, 232,674 dollars for cotton goods, and 242,300 dollars for linen goods; its exportations amounted to 5,993,631 dollars, of which 4,439,890 dollars were for copper ore, 553,168 dollars for coffee, 356,499 dollars for sugar, 368,868 dollars for tobacco, and 130,849 dollars for cotton; 160 vessels entered its port, of which 103 were American, and it received in duties, &c., 821,254 dollars. It has jurisdiction over a population of 91,512, of which 28,859 are in the town and villages, 8882 on 123 sugar estates, 27,456 on 604 coffee estates, and 26,315 on 3524 farms. The whites number 19,768, the free coloured 21,944, and the slaves 49,800. Four leagues west is the village of Cobre, or Santiago del Prado, containing 2000 inhabitants, chiefly occupied in working the copper mines in the neighbourhood.

There are but few British subjects established in the province of Santa Jago de Cuba, with the exception of those engaged in copper ore mining, and indeed few foreigners of any nation, with the exception of Frenchmen, who are found in considerable numbers in and around Santiago, both from France and her ancient colonies, or their descendants, and whose example and exertions have had great influence on the agricultural prosperity of the province; the cultivation of coffee may be traced to their immigration.

ARRIVALS at St. Jago de Cuba during the Year 1840.

Spanish, 132 vessels, 13,879 tons; British, 125 vessels, 23,667 tons; American, 124 vessels, 19,912 tons; French, 29 vessels, 6305 tons; Hanseatic Towns, 10 vessels, 1698 tons; Dutch Colonies, 6 vessels, 376 tons; Columbian and Mexican, 3 vessels, 200 tons; Danish, 1 vessel, 150 tons. Total number of vessels, 430; tons, 66,187.

The Spanish arrivals were chiefly from the Peninsula, with flour, wine, brandy, hardware, dried fruits, soap, spices, coarse earthenware, provisions, drugs, silk goods, and a few other manufactures.

The British arrivals were principally direct from Great Britain, in the employ of the English mining companies, with coals, mining machines, tools, powder, and various mining

supplies; and a few from British North America with cod fish, whilst twice or thrice per annum a vessel arrives from England with an assorted cargo of earthenware, hardware, sugar pans and mills, cutlery, iron in bars, powder, sheet copper, and glass.

American arrivals almost exclusively from ports in the United States with provisions and lumber, naval stores, and a few dried goods of native and other produce, candles, soap, furniture, manufactured tobacco, and some hardware and machinery.

The French arrivals were from France, with wines, brandy, silk goods, furniture, mirrors, oil, candles, perfumery, jewellery, porcelain, and a few other articles of luxury.

Hanseatic vessels, almost entirely from Bremen, with dry goods, hardware, gin, and some provisions.

The Dutch colonial arrivals were with dry goods, fruits, and provisions.

The Colombian and Mexican vessels were from Campeachy and Lisat, with grass bags, grass ropes, and hides.

The Danish vessels from Hamburg, with dry goods and provisions.

The imports of late years have been nearly equal, and are expected to continue so.

Spanish imports for the year 1841 amounted to . £ 319,320 sterling.

British imports for the same period " . . . 18,999 "

But in comparing the two amounts, the fact must not be lost sight of, that large quantities of British dry goods, hardware, and earthenware, are annually imported from *Jamaica in Spanish bottoms, chiefly on account of the difference in duty*, and also from the facility of selecting the above-named articles as cheaply in Kingston as in London, and with the advantage of being able to proceed there and return in three weeks' time. But it must not be concealed that the Hanseatic Towns interfere with British imports, underselling us in many German articles of hardware, cotton, woollen and linen goods, and glass; although generally speaking, they are considered inferior to British manufacture of a similar kind.

EXPORTS from St. Jago de Cuba during the Year 1840.

A R T I C L E S.	Quantity.	A R T I C L E S.	Quantity.

In 1845 there arrived at St. Jago de Cuba, 93 British vessels, of 28,537 tons' burden, value 10,301L.; of which there were from Great Britain 9 vessels with coals; 3,039 tons; 864L. value: 1 with machinery, 335 tons, 464L. value; 1 with powder, 328 tons, value 101L.; 24 with sundries, 8,348 tons; value 6,766L.; 33 in ballast, 10,966 tons: total from Great Britain 68 vessels, 23,016 tons, value 8,195L.;—2 from Jamaica with sundries, 415 tons, value 356L.; 1 with fish, 95 tons, value 250L.; 1 with rice, 31 tons, value 800L.; 5 in ballast, 662 tons:—9 from Grenada in ballast, 3008 tons:—1 from Bermuda in ballast; 265 tons: 1 with onions, 25 tons; value 300L.;—1 from St. Vincent in ballast, 200 tons:—1 from St. Thomas in ballast, 194 tons:—1 from Curazoa in ballast, 211 tons:—1 from Porto Rico in ballast, 291 tons:—1 with fish, from St. John's, 124 tons, value 400L.;—total from other parts, 25, 5521 tons; value 2106L.;—total from Great Britain, 68, 23,016 tons: value 8195L.;—total, 93 vessels; 28,537 tons; value 10,301L.

There departed from Cuba 96 British vessels of 29,452 tons' burden, value 387,170L., of which there were for Great Britain, 81 with copper ore, 27,010 tons, value 374,640L.;—1 with produce, 300 tons, value 8000L.; total for Great Britain 82 vessels, 27,310 tons, value 382,640L.;—2 for New Orleans in ballast, 200 tons; 1 for St. Cruz in ballast, 265 tons; for Jamaica with produce, 84 tons, value 1550L.; 1 for Manzanella with produce, 252 tons, value 2,000L.; 2 in ballast 411 tons.;—1 for Montego Bay in ballast, 425 tons;—1 for Crimfucyos with fustic, 291 tons, value 200L.;—1 for Halifax with produce, 65 tons, value 130L.;—1 for Havana with fish, 124 tons, value 400L.;—1 for Bermuda with produce, 25 tons, value 250L.;—total for other parts 14 vessels, 9142 tons, value 4530L.;—total for Great Britain 82 vessels, 27,310 tons, value 382,640L.

During the past four years there has not been any great difference in exports, with the exception of coffee and copper ore.

The exports of coffee have fallen off greatly during the last three years, owing to excessive drought, but they may be expected to revive; whilst those of copper ore have greatly increased, excepting during 1846. The raising of the latter article only commenced fourteen years back, from which time it annually augmented in quantity, but its richness or quantity of metal contained in the ore has decreased.

CHAPTER XVI.

DESCRIPTIVE AND AGRICULTURAL SKETCHES OF CUBA.

So little that can afford information respecting Cuba, and which can be relied on, is known in Europe, that we have endeavoured to condense the various statements and descriptions upon which we can place any dependence,* and having reduced these descriptions to the least space that would be satisfactory, and interesting to the general reader, as well as to those who wish to acquire a more especial knowledge of Cuba.

This magnificent island is very generally surrounded with reefs, within which are many good harbours, and through which are many safe channels. Of the interior of Cuba, the descriptions hitherto given have been remarkably meagre. On leaving Havana for the interior, there was until the railway to Guines was constructed, scarcely twelve miles of road fit for an European carriage. The *rude volante* was, however, dragged over rocks and ruts. Railroads, constructed by Americans and by English engineers, and chiefly with British capital, have, to a considerable extent, opened the interior.

Havana, contains a population of above 100,000 inhabitants; four contain populations from 12,000 to 24,000; nine from 4000 to 9000; nineteen from 1000 to 3000; twenty-four from 500 to 1000; forty from 250 to 500; sixty seven from 100 to 250; and fifty-four below 100.

There are three principal high roads under the care of the Junto de Fomento but they are in bad condition even during the dry season, and quite impassable in most places during the rains. From each other roads branch off. The one from Havana to Pinar del Rio passes through Guatao, el Corralillo, la Ceiba del Agua, Capellanias, la Puerta de la Guira, las Canas, Artemisa, in the Partido San Marcos, fourteen leagues from Havana, las Mangas de Rio-Grande, Candelaria, San Cristobal, los Palacios. Hence west through the Paso real de San Diego, la Herradura, Consolacion, Pinar del Rio, forty-five leagues, San Juan y Martinez and Guane.

From Havana to Santiago de Cuba, the *route* passes through Jesus del Monte, Luyano, San Miguel, Santa Maria del Rosario, Tapaste, Aguacate, Ceiba-Mocha, Matanzas, Limonar, Taberna del Coliseo, Cimarrones, Guamutas, Ceja de Pablo, Alvarez, Rio de Lagua le Grande, Esperanza or Puerta de Golpe, Villaclara, Taberna del Escambray, Sagua la Chica, Guaracabuya, Santo-Espiritu, Rio Sasa, Ciego de Avila, San Geronimo, Arrogo Tinima, Puerto Principe, Guaimaro, Rio Jobabo, las Tunas, Paso del Selado, Rio Cauto, and Cauto del Embarcadero, Bayamo, Rio Cautillo, Jiguani, Rio Baire, and Rio Contramæstre, Palma-Soriano, Rio Yarago, Cuba.

* By far the most valuable sketches are those condensed from "Notes on Cuba," 1844, by an American physician.

From Havana to Trinidad the route passes through Francisco de Paula, Taberna del Dique, Lomas de Camoa, San Jose de las Lajas, Sitio and Lomas de Candela, los Guines, Pipian, Bermeja, Alacranes, el Caimito, Rio de la Hana-bana, Rio Damuji, in the Paso de los Abreus, Pueblo and Rio de Caonao, River Aumirs, and several other rivers, among which are el Gaudan, San Juan, Guacabo, and Trinidad.

After leaving Havana for the country, the road passes through well-stocked farms, and then trimmed by lime hedges, with white aromatic flowers, both equally impenetrable to man or beast; also, loose stone fences, built of the jagged, honeycomb coral rock that abounds throughout the country. These often enclose whole acres of luscious, fragrant pines, each sustained by a short foot-stalk above the circle of thorny leaves composing the plant, that spread low over the ground. The pine-apples often are observed in all stages of growth. Some small, and blue, with half-withered flowerets that blossom over the fruit; others ripe, large, and of a golden hue; and a few, the *hardier kind*, of a reddish-green tint.

Fields are passed of plantains growing thickly together, bearing above their small frail stems heavy bunches of green fruit, with their terminating cones of flowers; with long, small, fan-like leaves, torn in shreds by the wind. Beyond the immediate neighbourhood of the city, its gardens, its farms, and its hamlets, are extensive sugar and coffee estates, with their portreros and woodlands, were common. The royal palm appears on every side.

"Sometimes," as remarked by the American physician, "isolated, and irregularly scattered over fields of sugar-cane, with their tall, straight trunks, and their tufted crowns of long, branch-like, fringed leaves, waving and trembling in every breeze, and glistening in the rays of the sun," they stood, like so many guardian spirits of the land keeping watch over the rich verdure, stretching far in the distance beneath them. Now, in long avenues of turned Corinthian columns, their long leaves reaching across and intermingling, forming one continuous high-sprung arch, and their trunks glossed with white lichen as with paint, they led the eye to the country mansion of the planter, with its cool verandahs, and its back-ground of neatly thatched negro houses. While in the adjoining portreros, large clumps of them sheltered with their shade the cattle grazing peacefully at their feet."

Coffee estates are occasionally passed, with their low pruned shrubs closely planted, and divided into large squares by intersecting alleys of mangoes, palms, or oranges; the latter laden with their golden fruit, very pictures of lavish wealth. The author of the "Notes on Cuba," crossed the island to the southern town of Guines by railroad. He says,

"The whole country was under high cultivation, appearing like one immense garden; and as the unwearied eye roamed over the wide expanse, and revelled in the beauties which hill and dale, woodland and field presented, it seemed impossible that aught but peace could dwell amid such scenery; and the heart would insensibly be filled with vague desires after some such resting-place for the evening of life.

"In travelling the women and men quietly enjoy their cigars, and the white, brown, and black races amicably intermingled without apparent distinction. At one place, where we filled our tanks, a lad brought us some cake and wine, which quickly brought around him my fellow-travellers, the exquisites; I joined also, but when I opened my purse to

pay for my portion, I learned that one of them had already settled for the whole company. Knowing it to be the custom on the island that the first of a party who finishes pays the scot, I did not mingle my expostulations with my acknowledgments of the compliment.

“Railroad Incidents.—Again our cars were in motion, and when one-third on our route, all of us were eagerly looking out of the doors and windows at a large crowd, that was gathered about a car some distance on the road before us. Rumour had told us, that the last summer the whole train had been stopped, and a large sum of money, that it was conveying to Guines, had been taken from it by robbers, who had been apprised of its removal. Although it had no foundation, we did regard with some anxiety the crowd, but soon found they had gathered to look on the downward train that had run off the track. Not one of the Monteros, however, lent the least assistance to the few whites and negroes attached to the road, who were actively engaged in replacing the cars. To our regret, we learned that it would detain us two hours; so we willingly consented to be rolled back to the last posada we had passed. Having been dinnerless, we made a general rush to its bar, where, amid garlicky sausages, bread, cheese, and Catalan wine, we forgot our disappointment.

“The sun had just set when we continued our journey; but the landscape was even more beautiful in the soft light of declining day than under his bright rays. The east wind had subsided into a perfect calm, as it generally does at this time, and an air of peaceful quiet hung over the whole land. Even the fringed foliage of the palms was motionless, and drooped pendant from the long and gracefully arched stems; reminding one of those bunches of ostrich feathers worn by the *belles* of past days, which then seemed to add so much to a stately figure and bearing. About us, surrounding objects were mellowed by the increasing shades, but in the distance all was becoming indistinct; save the giant *seyba*, whose wide-spread foliage, like a vast umbrella, raised in mid-air, was still plainly visible above the gloom below; and the rows of tall palms on the bare ridges of distant hills, whose trunks and tufted crowns were painted in bold relief against the clear sky. Star after star now rapidly appeared, for here no twilight forms the imperceptible link between day and night, and the whole firmament was soon blazing with its thousand lamps.

“Now and then we passed an estate, on which the negroes were clustered around large fires of corn-husks, which they were removing from the Indian grain, preparatory to grinding it for their morning meal. The fires were sometimes close to the road, the flames shone brightly on their laughing faces, and their loud cries rang merrily on the air as they cheered us. At the stations where we stopped there were also lights, and some fires along the road; and many curious inquiries were made about the cause of our delay. But our attention was soon engrossed by a large basket of excellent Galician ham, bread, cheese, olives, cakes, sugar-plums, and wine, among which several bottles of champagne figured conspicuously. The whole had been furnished at our last stopping-place, by the liberality of a fellow-passenger, one of the officers of the road, who brought us all around it to partake of its varied contents.

“*SAN JULIAN DE LOS GUINES*, during the dry season, is one of the most pleasant inland towns in Cuba. It then lies on a hard, black soil, and is free from that fine dust so annoying on *red lands*. When the rains set in, about July, from the streams that meander around and through it, and the deep ruts in the road, I suspect it rests in a perfect quagmire. It contains 2500 inhabitants, who are remarkably civil to strangers; and being at the terminus of the railroad, forty-five miles from Havana, and only twelve miles from the south coast of the island, it has lately increased suddenly in importance. This is evident from the number of spruce modern shops intermingled with its ancient rusty *tiendas*, and a certain lively, flourishing look, quite uncommon in a Cuba country town. The invalid will here also escape, in a great measure, from the drifting rains of the northers; the mountains on the north almost completely exhausting the water of the clouds before they reach the town.

“The houses have before them wide, smooth pavements, protected from the rays of the sun by sheds, under which one might enjoy a promenade, even at mid-day. It contains a large church, painted blue, a favourite colour throughout the island for public

buildings. There was also a commodious and cleanly-kept hospital for the destitute in the town; barracks for soldiers; a public hall; a large ball-room; and, as a thing indispensable to the happiness of the inhabitants, a spacious cock-pit.

"The market was filled with bunches of green plantains, and heaps of yams, yuca, sweet potatoes, and other vegetables. A long shed covered the butchers' shambles, with large slices of beef and pork hung along its whole front. Jerked pork, a favourite preparation of the meat with the creole, was being prepared close by, being hung on poles over the smoke of a fire, having been first salted, the only method by which meat can be at all preserved in this perpetual summer clime.

"The market had a cook's-shop, with a dozen parrots in cages before it, which by their screams seemed to invite all within hearing to partake of the savoury dishes exposed on the shelves. Among them were several with a light green plumage and yellow crowns, brought from Mexico, and highly valued for the ease with which they are taught to speak.

"The creole is always an early riser. Several were engaged in sweeping the pavement; others were clustered around the milkman's cow, which had been brought to their doors, and were waiting their turn to have their pitchers filled from the slow stream, while a calf, tied just without tasting distance, looked piteously on, and at times showed signs of impatience, as he saw his morning meal borne off. When all had been supplied, he was muzzled, and his halter tied to the extremity of the cow's tail. One rush to her bag was tried, but the cruel netting frustrated all attempts to taste the bland fluid, and the poor animal quietly followed in the rear, as the man drove his cow to the houses of his other customers.

"At other doors, the *malhokero* was counting out his small bundles of green fodder, each containing a dozen stalks of Indian corn, with the leaves and tassels attached, the common daily food of the horse. On their pack-horses were bundles of small-sized sugar-cane, neatly trimmed and cut into short pieces; selected small, on account of their superior richness, offering to the creole a grateful refreshment during the heat of the noon. Others carried large matted panniers, slung over their clumsy straw saddles, filled with fine ripe oranges, the favourite and healthy morning repast of the native and the stranger, the healthy and the invalid.

"As the day progressed, mounted monteros were seen galloping through the streets, just arrived from their farms, each with his loose shirt worn over his pantaloons, its tail fluttering in the breeze, while his long sword, lashed to his waist by a handkerchief, dangled at his back. Then there was the heavy cart, laden with sugar for the railroad depôt, drawn by eight strong oxen, the front pair some twenty feet in advance of the rest; its freight of boxes, bound down firmly with cords, and covered with raw hides. By its side the driver stalked, dressed in a loose shirt and trousers, and a high-peaked straw hat with a wide rim on his head. He held in his hand a long pole, armed with a goad, with which he urged forward his slow-moving team; often striking the sharp nail, at its extremity, repeatedly into the flank of an ox, until the poor animal, in his endeavours to escape, seemed to drag the whole load by his sole strength. Other carts were returning to their distant sugar estates, laden with planks cut into proper sizes, and fastened in packages, each containing all the sides to make a sugar-box; thus put up, by our ingenious northern friends for the Cuba market.

"The arriero with his pack-horses, eight or a dozen in number, was also seen urging them on by his voice and the occasional crack of his whip; while they staggered under their heavy loads of charcoal, kegs of molasses, or of aguardiente, and the halter of each being tied to the extremity of the tail of the horse before, moved in single files, carefully picking their way.

"Beyond the town of Guines farm after farm occupied the grounds; some sowed in Indian corn as closely as oats, and just springing from the soil, intended for food for horses and cattle; or planted three together, the hills not two feet apart, already in tassel, and bearing the nearly mature grain. Others were covered with sweet potato vines and pumpkins; there was also a plentiful show of okra and tomatoes, salad, carrots, turnips, and tall, tree-like cabbages, with yuca, yams, and other tropical vegetables, giving to the grounds a thriving appearance. Long canals, with their sides embanked, traversed the flat plains; and their rapid streams, elevated above the level of the soil, in several

places were drawn off, to irrigate the land, by breaking through their sides, or by obstructing the course of the stream by temporary transverse dams.

“The rivers in this flat district, which run parallel, are generally elevated above each other, so that many streams run from one and empty into the river below. I was informed by an intelligent engineer on the Guines and Havana railroad, that in surveying its track, they found this to be the case of three considerable streams, and that on one occasion, during a freshet, those most elevated poured their superabundant waters, by side streams, into the lowest, and so swelled its current, that a large and strong stone bridge was carried away by it. The soil was black, resembling marsh-mud, but without a grain of sand in it, the substratum being lime-stone. It was so tenacious, that a bank a foot thick served to confine the waters of a canal, four feet wide, which, instead of washing away the sides, left a white deposit on them.”

The foregoing descriptive sketches are considered applicable to many of the small towns and rural districts of Cuba.

The *portreros*, with grass which grows rapidly after the first rains, afford abundant pasturage to large herds of oxen and horses. Flocks of sheep and herds of swine, under the care of a few negroes, also feed near the unenclosed, cultivated fields of the neighbouring farms. These are frequently unprotected by either fence or hedge, and the cattle are either tethered or under the care of keepers, or were enclosed in *portreros*.

Negro Dwellings.—The cottages near Guines are all thatched with palm leaves, with walls of poles, and mud plastered thickly on them to fill up the cracks, the floors being of the latter material, and often not higher than the ground without. They contain little furniture; a table, one or two stools, a cot, and a few plates or jugs, composed all the household articles; while women, dressed often in a single gown, half open and half off their shoulders, and squalid, dirty children, with nought save the covering nature gave them, form the family group. The hut, however, is tastefully shaded by groups of cocoas,* or wide-spread foliage of an almond-tree, with the ground blackened by the last crop of nuts, and surrounded by plantains and orange and lemon-trees, with *air-plants* hanging from every grove, or covering the rocks, wherever the foliage of shrubbery protected them from the rays of the sun. The slaves all over the island are remarkably addicted to their dances, and fond of dress. Mr. Turnbull's account of the severity with which they are flogged and treated, is asserted by other authorities to be greatly exaggerated. But wherever there is slavery there must be harshness, and the last revolt of the slaves in Cuba was certainly suppressed with little regard to their lives. If the slave trade be continued, and the number of slaves conse-

* “The cocoas looked so tempting, that I asked the price, when a lad offered to procure four for one rial, or twelve cents. He was not more than ten years old, but without a moment's hesitation, he climbed up the tall trunk of one of the trees, resting only for a moment mid-way in his ascent; and holding on to the long branch-like leaves, crawled into its tufted crown, and pushed off the fruit with his feet, crying out to me from his giddy height to take care of my head. The little fellow seemed quite fearless, winding his light body between the leaves, more than fifty feet in the air, and stretching out his full length to reach the best nuts. He descended without being at all fatigued, and procuring a knife, cut through the rind and shell of the nut, which, when green is not hard, and offered the vegetable milk to me. In its unripe state it contains about a pint of refreshing fluid, and the pulp is then so soft, that it can, like cream, be scraped from the shell with a spoon, but neither has that rich oily flavour they possess when mature.”—*Notes on Cuba.*

quently greatly increased, the Spanish creoles may well dread a period of as terrible retribution, as has been experienced in Hayti. We see little future security for Cuba unless the slave trade be entirely abolished.

Agriculture.—The statistical tables that we have already given exhibit the agricultural productions of Cuba, and greatly important as they are, the whole product is but small in proportion to the productive capabilities of the soil and climate of this naturally, perhaps, the most fertile of the large islands of the world. Cattle are reared, or rather without care, breed in numerous herds. The number is estimated at above 1,500,000.

Climate.—The climate of Cuba is not so regular as that of the more southerly islands, and from the proximity of the north-western parts to the continent of America, it is sometimes so cold that at some few hundred feet above the sea ice occasionally forms. Snow never falls, but hail-storms occur.

It has its rainy and dry seasons, but they do not appear to be regularly defined. Destructive hurricanes have sometimes devastated the country. Although some low parts are unhealthy, the climate of Cuba is generally salubrious. The island is frequented by invalids from the United States, and during late years inns and boarding-houses, with good accommodation, have been established by American citizens. Earthquakes occur in the eastern parts of the islands, and have occurred at Havana.

Forests.—Immense districts, especially the mountain regions, are still covered with trees. Among which the magnificent Ceiba and gigantic mahogany trees, with other valuable woods for furniture and for ship-building abound. Many varieties of majestic palms, plantains, and some beautiful hard woods also abound. Maize and the yuca grow in Cuba, and many esculent roots, and fruits are indigenous.

Animals.—One indigenous quadruped only has ever been known. This is the *huitia*, which resembles a great rat, about eighteen inches long without the tail. Amphibious animals are, however, abundant, among which are the alligator, *manati*, tortoise, and others. The domestic dog and cat have become wild, and it is said fierce. Large serpents, from ten to twelve feet long and from six to eight inches thick are met with, but not frequently. Mosquitoes and some other insects are numerous, and in the low districts very annoying. Asses and pigs are numerously bred. Birds of the most beautiful plumage enliven and adorn the country. On the coasts and rivers many delicious varieties of fish abound, with which the markets, especially that of Havana, are supplied.

Minerals.—It does not appear that much gold or silver have ever been found in Cuba. Excellent bituminous coal has been dug near Havana, and iron is said to abound in the mountains. The copper mines, near Santiago, were worked and abandoned in the seventeenth century. Three companies were formed some years ago to reopen and work these mines, which have been executed by great

outlay and by the aid of steam engines, with considerable success. The ore has been chiefly imported for smelting to Swansea. A copper mine in the neighbourhood of Santa Clara has been opened by an American company; but from its inconvenient access, and the less rich mineral, it has been worked with far less advantage than those near Santiago and Cuba. Bitumen, asphalt, marble, and jasper are also found, but the wretched means of internal communication, prevents profitable enterprise at any distance from the sea coast; except as far as regards the railway (forty-five miles) to Guines and four very minor railways, all constructed by Americans or Englishmen, the means of transport are both difficult and expensive.

Steamboats have for some years been established for conveying passengers between Havana and the other ports of the island; and this mode of visiting all places on the sea-coast has become convenient and speedy.

No foreigner can land in Cuba without procuring security to the government for good behaviour from a responsible inhabitant.

Revenue.—The revenue is derived from—1. Import and export customs duties; 2. *Impuestos interiores*, which comprise taxes on the consumption of butchers' meat, stamped paper, taxes on hucksters, municipal dues, sales of indulgences, taxes on cock-fights, lotteries, &c; 3. Deductions from church revenues; 4. Deductions from official salaries; 5. Royal lands, vacant tithes and estates, vendable offices, &c.; 6. Casual receipts, deposits, confiscations, donations, &c.

Government.—The captain-general is supreme military commander of the whole island, and civil governor of one of the two great divisions of Cuba. The governor of the other part (Santiago de Cuba) has independent civil power, responsible only to the court of Spain. The captain-general is, however, *ex officio* president of the *Audiencia Real*, or supreme court. The municipalities have their *ayuntamientos*, and the rural districts *jueces pedoneas*, or magistracies.

The History of Cuba consists of little more than a catalogue of captains-general and bishops from the time of the first Captain-general Velasquez in 1511 down to the year 1809-10-11, when the ports of Cuba were opened to the ships and trade of foreign countries. During which period fifty-four or fifty-six captains-general ruled, or misruled, this splendid island. General Tacon, who was appointed in 1825, was by far the most efficient of these governors.

The early settlement of Cuba, the expeditions to Mexico, the capture of Havana by Admiral Peacock and Lord Albemarle, and the opening of the ports, we have already noticed: for other particulars *See Spanish Colonial Policy*.

CHAPTER XVII.

PORTO RICO.

THE fertile island of Porto Rico lies between the latitudes of 17 deg. 54 min. and 18 deg. 31 min. north, and the longitudes of 65 deg. 39 min. and 67 deg. 21 min. west. Its length is stated to be about 100 miles, its average breadth about thirty-nine miles. Its area is computed at about 3750 square miles, being about 2500 square miles less than the area of Jamaica. A ridge of mountains extends from the east to the west end of the island. Some of the rivers which flow down are navigable for small vessels; and some of the numerous coves and inlets form good harbours for large ships. The soil is generally fertile and beautifully undulated. There are no serpents or other reptiles. There are large rats, which do great injury to the sugar-canes. The climate is generally salubrious; but some parts are subject to rains, others to droughts.

Porto Rico was discovered by Columbus in 1493. It was invaded in 1509 by the Spaniards from St. Domingo; and the natives, said to have amounted to 600,000 in number, were exterminated in a few years. The Spaniards, however, derived no profit from this island, though it subjected them to great expense. Ponce de Leon, who, in his voyage in search of the fountain of perpetual life, discovered Florida, was the explorer and conqueror of Porto Rico.

The laws of Spain, as administered in Cuba, are those of Porto Rico; and in the latter these laws are particularly severe in regard to foreigners; especially if Protestants. Every foreigner who arrives in Porto Rico, must, before he lands, find security on the part of responsible residents, for his good behaviour. After six months, the foreigner must either domiciliate or leave the island. In order to *domiciliate*, he must profess the Roman Catholic faith, the only religion tolerated. If he decline, he must leave Porto Rico. The difficulties in the way of a foreigner establishing himself in trade, even when domiciliated, are exceedingly vexatious, if not in partnership with a Spaniard. Foreigners, however, have managed, not only to overcome all religious scruples, but to become proprietors of estates; and the rapid agricultural improvement is chiefly owing to the enterprise of such foreign residents.

The population, according to an estimate based on the last census, is stated at 500,000 inhabitants of which there are not more than about 50,000 slaves. Free labour prevails in this colony. Among the slaves there are many of those, or their offspring, which the emigrants from Spanish St. Domingo brought with them; most of the settlers from the Danish, French, and British islands did the same.

Porto Rico is an agricultural colony. It has no manufactures, nor have any mines of gold or silver, or other minerals, been worked. Gold is found in small lumps and in dust in the streams running from the mountains, and a licence has been recently granted to a company in the island to search for gold, which is supposed to be abundant on the mountains. Copper, iron, and lead, have also been found. A coal mine has also been discovered, but in a place of very difficult access, twelve miles inland from Port Arecibo. There are two *salines* or salt ponds, worked by the government, but yield only about 157 tons of salt.

Roads.—There are no roads of any extent for wheel carriages in the island. All travelling is performed either on foot or on horseback.

According to an official return of 1840, the land cultivated, and its produce, were as follows :

ARTICLES OF CULTURE.	Acres in Cultivation.	PRODUCE.	Qu ^{an} tity.
	number.		number.

During the last fifteen years several thousands of acres have been cleared and cultivated. The lands are often held in very small lots.

In 1828, 1,437,285 acres were held by 19,140 proprietors. At the same time, 423 individuals were proprietors of estates regularly worked by slaves ; 275 of which were sugar, and 148 coffee plantations ; 17,440 proprietors were graziers who bred cattle, and who also raised provisions and some coffee. In 1802, there were but twenty-nine sugar estates in Porto Rico, and the total value of exports was estimated at 57,500 dollars.

We are indebted for valuable information relative to Porto Rico to Dr. Reid, who practised for some years as a physician on that island, from whence he has recently returned.

“Previously to 1828,” says Dr. Reid, in a manuscript report, “Porto Rico was little known to, and less frequented by, foreign adventurers on account of the policy observed by the government, which had a tendency to exclude strangers, by opposing almost insurmountable obstacles to their settlement.

“Anterior to the period alluded to, strangers were required to produce the most undoubted evidence of being Roman Catholics, in order to become domiciled, and they were also under the necessity of becoming naturalised after five years’ residence—I say that formerly this was not optional but of necessity. A stranger, before he was permitted to

land in the island, was to give security for good political and moral conduct, and supposing that he were able to surmount these difficulties, such were the jealousy and illiberality of the government, that few were induced to remain in a country where no prospect of success appeared.

"In 1828, however, the leniency and liberality of Don Miguel La Tone, then captain-general, by relaxing the rigour of former observances, had great effect in removing the impediments to the establishment of foreigners in the island. La Tone acted strictly according to the spirit of the Real Cedula of 1815, having for its object the encouragement of agriculture and commerce in the Spanish colonies.

"Thus the *Domicilio* was procured by paying a trifling sum of money, and by the applicant complying with certain formalities.

"Moreover, government encourages, instead of damping the enterprise of foreigners, convinced, that in this manner, the resources of the island would be best developed.

"In consequence of the encouragement given under the administration of La Tone, a considerable migration took place to this island.

"Planters from the neighbouring islands of St. Croix and St. Thomas, sold their estates and brought their slaves and capital to this country, lured by the superior fertility of the soil, and the liberality of the government as administered by La Tone.

"Several planters of the windward British and French islands, acted like the people from St. Thomas and St. Croix.

"Merchants also had their attention attracted towards this spot, and the establishment of several commercial houses now existing was effected.

"Seconded by foreign enterprise and foreign capital, this island has continued to prosper in a most extraordinary degree since 1828 ; and it has been a source of considerable revenue to the mother country.

"But notwithstanding the rapid improvement which has been effected in this island, and the continued increase of its staple exports, the improvement would have been still greater, and the export considerably larger, *but for the oppressive duties imposed upon all articles of necessary consumption, and the frequent heavy exactions made by the government towards the support of the war in Spain.*

"These causes, by lessening the profits of the planters, have prevented them from extending their estates. Thus the advancement in the cultivation of the soil is more due to the continued influx of new settlers with their important capital, than to the prosperity and advancing operations of the old.

"Some years ago the great mass of the inhabitants did not require, and scarcely knew, the use of many articles which are now considered necessary.

"Of this class are fine cotton goods, fine linens, and woollen cloths. The natives of the present day, throughout the island, are extremely fond of dress and fine apparel.

"Formerly people were very remiss in furnishing their houses ; at present they pay great attention thereto. I might multiply instances of the advancing civilisation of the natives, forming by far the greatest proportion of the population.

"All the machinery for the manufacture of sugar and rum is allowed to be imported duty free. Men cannot be imprisoned for debt, nor can a planter's estate be sold, or any of his implements of agriculture and manufacture, unless he owes at least two-thirds of the whole value of his estate.

"If a proprietor sell an estate or a house here, in order to remit the proceeds, he is required by the government to pay 10 per cent on the amount of the property sold."

The sugar estates and other plantations are situated on the sea-coast, near the capital and other towns or *pueblos*.

Slaves.—The following are the regulations respecting slaves in the Island of Porto Rico. In every large and small town there is an *alcalde* or justice of the peace, and likewise a person appointed for the special protection of the slaves, called a *syndic*, who is expected to see that justice is done them. It is always in the power of a slave to purchase his freedom as soon as he can collect sufficient money for the purpose, and the master and slave generally come to an understanding as to the price, if the value is not ascertained, which it generally is in most instances, from the master having purchased him, or from other circumstances; and he cannot demand more than he has given for him, unless he has taught him any trade, when he is allowed to demand a higher price, but the general value of a slave not knowing a trade is 300 dollars, though some are not worth so much, and if they cannot agree, the slave goes to the *syndic*, and one person is appointed on the part of the slave, and another on that of the master, and in case of difference, the *alcalde* appoints a third, who fixes the price, which the master is then obliged to take. The slave can also change his master, but the owner is not bound to sell him to any third person if he does not like it, unless either of the following can be proved against him, that the slave is either badly fed, badly clothed, ill-treated, or prevented from going to church, and if the slave can prove either of these, he may go before the *syndic* and demand to change masters; the *syndic* will then order the master to sell him within a specified time, and the slave has a paper given him, authorising him to find another master; the master is at the same time ordered to fix his price, and if no one will give the sum asked by the master within the time fixed by the *syndic*, he is obliged to take the highest price that may have been offered for the slave. All this appears favourable for the protection of the slaves, but it is principally those only in the towns who have means of access to the *syndic*, and can derive advantage from it, as in the country, when slaves have bad masters, it is a very difficult thing, and almost impossible for them to make a complaint, for from the strict regulations on the estates it is difficult for them to absent themselves a sufficient length of time to go to the *syndic*; when, however, they are well-treated, which they are in most instances, they are very careless about purchasing their freedom, as after they are free, they are subject to serve in the militia, and fill the parochial offices. When a slave has saved a little money, sufficient to purchase a head of cattle in which the island abounds, he can buy one with his master's consent, and let it to a free man, who pays him half the earnings, and the master sees that the slave has justice done him, whereas, if he were free, he would not have any master to protect him. Many slaves are enabled to become possessed of property much more than sufficient to purchase their freedom, but when they die, what they leave, becomes the property of the master. But the masters do not take it, but give it to the wives and children of the deceased. The distinction, however, between black and white inhabitants is not made with reference to colour, for a black, as soon as he has purchased his freedom, is considered a white man; and when they show any hair upon their heads, they are taken to serve in the militia, the Spanish law not allowing any but white people to become soldiers, except three companies of black artillery who are distributed over the island, having officers of their own, with white

officers over them. There are in the island seven battalions of militia of 1000 men each, formed from the free inhabitants, independent of the regular troops, who furnish guards over the different prisons in the towns and villages, keep the slaves in subjection, and perform other duties.

Labour.—The work on the estates is generally done by both free people and slaves; the free people are employed in planting and cutting the canes, and digging ditches, but it is very difficult to get them to work in the boiling houses, where the negroes are principally employed; on a few estates, however, where they are well-treated, and are regularly paid, they are employed at all the different works that are in hand indiscriminately with the negro slaves. What the proprietors of estates complain of with regard to the free labourers is, that they cannot depend upon their remaining with them, but from some whim, or from having managed to get a little money in advance, they will leave their work at once, frequently without giving any notice, and at a time, perhaps, when it may be very inconvenient to lose them: whilst they work, the general pay which the free labourers receive is six dollars, or about twenty-four shillings per month, and they receive the same provisions as the slaves, and the negro drivers have charge over them as well as the slaves.

The north and south sides of the island are so much separated by the chain of hills which run through it, that whilst they have had abundance of rain on the north side, the crops have considerably failed on the south side from the want of it. The British North American colonies have latterly purchased large quantities of Porto Rico produce, and the fish they import is more approved than that of either French or American curing.

SEAPORTS.—The following are the legal ports for the importation of goods, and the exportation of produce: San Juan de Porto Rico, the capital (population 30,000); Mayugas, Ponce, Guayama, Aguadilla, Cabo Royo, Guayanilla, Salinas, Manati, Patillas, Penuelas, and Saguerillo.

The principal articles exported are, sugar, rum, molasses, coffee, cotton, tobacco, hides, live-stock, dyewoods, lignum vitæ, and timber, ground provisions, rice, salt, &c.

The sugar is nearly all muscovado, no clayed sugar being made in this island. The molasses is of a good quality, and exported chiefly to the United States. The rum in general is inferior to that manufactured in the British West Indies.

The coffee of this island is of good quality, but scarcely equal to that of St. Domingo in flavour.

The cotton is of fair quality, but the fibre is short. Indigo is indigenous.

The tobacco, though rather inferior to that of Cuba, is of good quality for smoking. It is produced only by free labour.

The hides are large, and the cattle are of a good breed. Numbers of them are carried to the neighbouring islands. The beef is good, and the cattle of Porto Rico are superior to those bred on the Spanish main.

Sugar.—In 1814, scarcely enough of sugar was grown for the consumption of the island. According to official documents, the quantity of sugar exported from all parts of Porto Rico in 1839, amounted to 69,245,783 lbs., valued at 2,423,602 dollars. The ports of exportation were—

Porto Rico, 9,441,247 lbs.; Guayama, 16,054,672 lbs.; Aguadilla, 990,771 lbs.; Cabo Royo, 1,134,762 lbs.; Fayaribo, 583,158 lbs.; Areibo, 8,009,435 lbs.; Naguabo, 1,198,782 lbs.; Humacao, 1,364,246 lbs.; Guayanilla, 2,686,529 lbs.; Salinas, 414,728 lbs.; Manati, 56,025 lbs.; Patillas, 643,362 lbs.; Penuelas, 5615 lbs.; Saguillo, 20,000 lbs.

Coffee.—The quantity exported during the year 1839, was 8,538,362 lbs., valued at 853,836 dollars. The ports of exportation were—

Porto Rico, 517,471 lbs.; Mayugas, 3,187,200 lbs.; Ponce, 634,691 lbs.; Guayama, 304,248 lbs.; Aguadilla, 2,134,014 lbs.; Cabo Royo, 283,977 lbs.; Areibo, 507,289 lbs.; Naguabo, 3525 lbs.; Humacao, 86,300 lbs.; Guayanilla, 288,115 lbs.; Salinas, 416,562 lbs.; Manati, 57,036 lbs.; Patillas, 24,325 lbs.; Penuelas, 92,609 lbs.

Molasses.—3,311,719 $\frac{3}{4}$ gallons of molasses, valued at 496,759 dollars, were exported during the year 1839. The ports of exportation were—

Porto Rico, 288,627 gallons; Mayugas, 446,734 gallons; Aguadilla, 2942 gallons; Ponce, 915,637 gallons; Guayama, 1,244,098 gallons; Cabo Royo, 37,895 gallons; Fayaribo, 57,746 gallons; Areibo, 88,888 gallons; Naguabo, 47,500 gallons; Humacao, 56,509 gallons; Guayanilla, 91,382 gallons; Salinas, 4108 gallons; Manati, 1810 gallons; Patillas, 28,933 gallons.

Cotton wool.—1,183,973 lbs. of cotton, grown in the island, valued at 189,435 dollars, were exported during the year 1839. The ports of exportation were—

Porto Rico, 361,484 lbs.; Mayugas, 503,022 lbs.; Guayama, 8170 lbs.; Aguadilla 309,097 lbs.; Guayanilla, 2200 lbs.

Live stock.—The value of live stock exported is given for the same year as follows: horses, 7023 dollars; mules 4340 dollars; horned cattle, 20,303 dollars.

Coin.—In 1839, 1104 dollars' value of gold coin, and 129,285 dollars of silver, were exported, = 130,389 dollars.

Hides.—673,832 lbs., value 60,644 dollars, were exported, viz.,

From Porto Rico, 423,888 lbs.; Mayugas, 159,047 lbs.; Ponce, 6210 lbs.; Guayama, 8399 lbs.; Aguadilla, 72,320 lbs.; Cabo Royo, 4474 lbs.; Areibo, 520 lbs.; Humacao, 1918 lbs.; Guayanilla, 1239 lbs.; Manati, 625 lbs.

Wood.—The value of timber exported was estimated at 24,236 dollars.

Rum.—649 $\frac{2}{3}$ puncheons, value 16,241 dollars, were exported in 1839; viz.,

From Porto Rico, 277 $\frac{1}{4}$ puncheons; Pouce, 127 puncheons; Guayama, 107 puncheons; Aguadilla, 40 puncheons; Fayardo, 23 $\frac{1}{2}$ puncheons; Areibo, 53 puncheons; Naguabo, 10 $\frac{1}{2}$ puncheons; Humacao, 4 puncheons.

Rice.—228,925 lbs. of rice, valued at 10,301 dollars were exported in 1839.

Dyewood.—The value exported in 1839, was estimated at only 494 dollars.

Corn.—Indian corn and grain were exported only to the value of 531 dollars.

Miscellaneous.—Articles not enumerated were exported to the value of 14,879 dollars, of which was salt to the value of 2701 dollars.

Total value of produce exported in 1839 was, 4,398,142 dollars, and in coin

130,389 dollars, and of 988,079 dollars, the value of deposited or bonded goods exported. The total value of exports 5,516,660 dollars.

The rum exported is chiefly to the British North American colonies.

Rum is immoderately consumed in the island by the common people.

EXPORTS FROM PORTO RICO IN 1840.

Sugar.—The quantity exported was 81,793,693 lbs., value 2,862,779 dollars.

Coffee.—The quantity exported was 12,450,114 lbs., value 1,254,011 dollars.

Molasses.—The quantity was 3,033,034 gallons, value 454,195 dollars.

Tobacco.—The quantity exported was 4,227,484 lbs., value 169,099 dollars.

Live Stock exported; viz.,

	dollars.
112 horses, value	4,783
86 mules "	4,308
3396 cattle "	117,090
Total	126,181

The total value of goods imported from Spanish ports, and under the Spanish flag, in 1839, was 725,740 dollars; in 1840, it was (with the exception of the imports from Cuba) 915,260 dollars. The amount from Cuba, under the Spanish flag, in 1840, was 217,232 dollars; under the British flag, 315 dollars.

The imports from the neighbouring colonies, under the Spanish flag, in 1839, amounted to 1,951,617 dollars; in 1840, to 2,617,489 dollars. In 1839, the value of imports from the United States amounted to 1,192,670 dollars; in 1840, to 1,279,477 dollars. In 1839, the value of the imports from Germany was 193,956 dollars; in 1840, 412,568 dollars. In 1839, the amount of Danish imports was 44,715 dollars; in 1840, none imported. In 1839, the amount of French imports, by French vessels, was 86,382 dollars; in 1840, it was 135,990 dollars. In 1839, the value of Dutch imports amounted to only 8615 dollars; in 1840, none imported. In 1839, British imports, under the British flag, amounted to 145,825 dollars; in 1840, under various flags, to 185,187 dollars. In 1839, Portuguese imports amounted to 833 dollars; in 1840, the imports, chiefly under the Brazilian and Spanish flags, from the Brazils, amounted to 517,982 dollars. In 1840, the value of imports from the continent of South America was 518,819 dollars.

EXPORTS 1839 AND 1840.

The value of exports to Spain, under the Spanish flag, in 1839, was 400,401 dollars; in 1840, under various flags to Spain, 1,816,658 dollars. The value of exports to Cuba, under the Spanish flag, in 1840, was 24,593 dollars. In 1839, the value of exports to the neighbouring colonies, under the Spanish flag, was 414,996 dollars; in 1840, under various flags, 671,058 dollars. The value of exports to the United States, under the American flag, was, in 1839, 2,588,482 dollars; in 1840, under various flags, 1,803,761 dollars. Exports to Germany, in German vessels, in 1839, amounted to 266,694 dollars; in 1840 under various flags, to 480,288 dollars. Exports to Denmark and her colonies, under the Danish flag, in 1839, 211,758 dollars; and in 1840, 14,386 dollars. Exports to France, under the French flag, was, in 1839, 292,054 dollars; in 1840, under various flags, 926,900 dollars. Exports to Holland, under the Dutch flag, in 1839, amounted to 10,965 dollars; in 1840, under various flags, to 18,180 dollars. Exports to Great Britain and her colonies, under the British flag, in 1839, amounted to 347,892 dollars; and under the same flag, in 1840, to 356,997 dollars. Exports to Italy, under various flags, in 1840, 148,825 dollars. Exports to Turkey, under the British and Austrian flags, in 1840, 11,282 dollars. Exports to the continent of South America, under various

flags, in 1840, 28,226 dollars. Exports to British America, in 1840, under the Spanish and British flags, 333,348 dollars.

In proportion as the Dutch and Danish trade with Porto Rico have been declining, the British has been advancing.

VESSELS of different Nations, which entered the Harbours of Porto Rico, in 1839.

Cotton.—The exports of cotton were 621,218 lbs., value 99,394 dollars.

Hides.—The exports of hides were 607,385 lbs., worth 54,664 dollars.

Rum.—There were exported 1100¾ puncheons, value 27,518 dollars.

Wood.—The value of wood for building exported, amounted to 21,517 dollars; the quantity of dyewoods exported, amounted to 1,261,795 lbs., value 7882 dollars.

Salt.—The exports of salt were 3995 bushels, value 3995 dollars.

Miscellaneous Articles were exported to the value of 15,911 dollars.

Specie.—The exports of coin amounted to 121,346 dollars.

The export of merchandise in bond amounted in value to 1,424,251 dollars.

The total value of Porto Rico products exported in 1840, was 5,088,911 dollars; which, with the value of specie and bonded goods, 1,424,251 dollars makes the total value of exports, for 1840, amount to 6,634,588 dollars.

12,547,910 lbs. of sugar, it appears, were exported in 1840, over the quantity exported in 1839; from which it would also appear that the cultivation of sugar had increased in this ratio in the course of one year, a proof of the advancing state of the agriculture of the island.

3,911,752 lbs. more of coffee were also exported in 1840 than in 1839.

IMPORTS IN 1839 AND 1840.

The total value of 1839 was 5,462,206 dollars. The imports of oil, wine, and fermented liquors, amounted, in 1839, to 290,095 dollars; spices, 9856 dollars; preserved and dried fruits, 22,777 dollars; salted meats, 85,095 dollars; various kinds of grain, 1,079,542 dollars; lamp oil, lard, &c., 124,346 dollars; salted fish, 250,521 dollars; miscellaneous articles, 95,705 dollars.

From which it appears that almost the whole of the cotton and hides put into bond were exported to Spain, and the flour was mostly taken out for home consumption; this last with other articles is frequently put into bond to delay payment of duties, and when the merchant's stores are full, no charge being made by government for rent. The cocoa was brought here because it could not go from Venezuela direct to Spain, but the trade having been since thrown open between the two countries very little more cocoa is likely to be brought here.

Prices of Export.—The average prices of the principal articles of export in the year 1844 were—

Rum.—22 dollars, equal to about 4*l.* 8*s.* sterling per puncheon, containing 110 gallons.

Cotton.—10 to 12 cents, or about 5*d.* to 6*d.* sterling per pound.

Sugar.—3 dollars, or about 12*s.* sterling per quintal of 100 pounds.

Coffee.—8 cents, or about 4*d.* per pound.

Hides.—9½ cents, or about 4½*d.* sterling per pound.

Cattle.—Large cattle, weighing 22 to 24 arrobas, or about 550 to 600 pounds each, 25 dollars, or about 7*l.* sterling; small cattle, weighing 18 to 20 arrobas, or about 450 to 500 pounds each, 25 dollars, or about 6*l.* 5*s.* sterling.

Molasses.—11 cents, or about 5½*d.* sterling per gallon.

Tobacco.—6¼ to 6½ cents, or 3¼*d.* to 3½*d.* sterling per pound.

They have not any manufactures on the island except soap.

The average prices of the principal articles of import in 1844 were—

From America.—Wheaten flour, 13 dollars per barrel; maize, ditto, 24 to 26 dollars per cask of 800 pounds; salt mackarel, 8 dollars per barrel; salt herrings, 5 dollars per barrel; smoked herrings, 3 rials per box; mess pork, 15½ dollars per barrel of 200 pounds; salt beef, 8 to 10 dollars per barrel of 200 pounds; lard, 12 dollars per quintal of 100 pounds; butter, 15 dollars per quintal; hams, 15 dollars per quintal; biscuit, 4½ dollars per barrel of 60 pounds; pepper, 12 dollars per quintal; tobacco, 9 to 10 dollars per quintal; tobacco (Manilla), 12 dollars per quintal; soap, 10 dollars per quintal; onions, 2 dollars per quintal; potatoes, 2½ dollars per barrel; cheese, 10 dollars per quintal; tallow candles, 16 dollars per quintal; sperm candles, 36 to 40 dollars per quintal; fish oil, ¾ of a dollar per gallon; linseed oil, 1¼ dollars per jar of 1 gallon; sperm oil, 1½ dollar per jar of 1 gallon; wrapping paper, 4 rials or ½ a dollar per ream; apples, 4 dollars per barrel; kidney beans, 5 dollars per barrel; rice, 3½ to 4 dollars per quintal; deals, 12 to 14 dollars per 1000 feet (1-inch thick); hogshead staves, 28 to 30 dollars per 100; iron hooks, 6 to 7 dollars per quintal.

From Spain.—Red wine (Catalonian), 28 to 30 dollars per pipe; white wine, 10 to 11 rials per arroba of 18 bottles; garlic, 2 to 2½ rials per string; wrapping paper, 6 rials per ream; tallow candles, 11 to 12 dollars per quintal (of bad quality); tunny fish, 8 dollars per quintal; earthenware, 6 dollars per dozen; oil, 12 rials, or 1½ dollars

per jar of 8 bottles; soap, 9 dollars per quintal; chick peas, 4 dollars per quintal; pastes (as maccaroni, &c.), $9\frac{1}{2}$ to 10 dollars per quintal; raisins, 2 dollars per arroba of 25 pounds; paper, 3 to 5 dollars per ream; cigar-paper, $1\frac{3}{4}$ dollars per ream; vinegar, 2 dollars per barrel; figs, 6 dollars per quintal; onions, $1\frac{1}{2}$ dollars per quintal; salt, 2 to $2\frac{1}{2}$ dollars per quintal; flour, 11 dollars per barrel; brandy, 14 rials, or $1\frac{3}{4}$ dollars per demijohn; beer, 2 to $2\frac{1}{4}$ dollars per dozen; gin, $1\frac{1}{2}$ to $1\frac{3}{4}$ dollars per demijohn of $3\frac{1}{2}$ gallons; olives, 8 dollars per quintal.

There is no goods can be imported under any flag* from all countries, without any difference in the duties, independent of those between goods imported in a foreign and Spanish ship; goods of all kinds can also be imported except fire-arms and gunpowder, the importation of which is prohibited except under special licence.

There will not be found to be any great difference in the amount of exports and imports in the years 1843 and 1844, as there is very little difference in the amount of the export and import duties in those years, as—

	dls.	cts.	£	s.	d.
In 1843, they amounted to.....	1,082,201	58	216,440	6	4

Money of the country.—The dollar referred to is the Macuquino, or dollar of the island, which is inferior to the Columbian dollar, varying from 3 to 18 or 20 per cent, at present it is $6\frac{1}{4}$ per cent inferior to the Columbian dollar, from 485 to 500 of which, according to the course of exchange, are equal to 100*l.* sterling. The Macuquino dollar is, therefore, not quite worth four shillings sterling, but at that rate it is valued in this statements as the nearest value. The Columbian doubloon of 16 dollars is worth 17 dollars Macuquino money, the Spanish doubloon is worth 18 dollars; but the prices vary according to the demand for either doubloons or Macuquino money.

Revenue and Expenditure.—The whole expenses of the island, including the civil and military establishments, are paid out of its annual revenues arising from the custom-house duties and other levies of different kinds, viz:

	dls.	cts.	£	s.	d.
Balance in hand the 1st of January, 1844.....	9,942	15	1,988	8	7 $\frac{1}{2}$
Revenue of 1844.....	1,672,521	57	334,501	6	3 $\frac{1}{2}$
Total.....	1,682,463	72	336,492	14	11
Expenses.....	1,642,397	22	328,479	8	11
Balance in hand the 1st of January, 1845.....	40,066	50	8,013	6	0

In the expenses, however, are included bills drawn by the Spanish government, paid in 1844, 79,999 dollars 37 cents, and other charges for account of Spain, making altogether 187,930 dollars, 96 cents, or 37,586*l.* 3*s.* 10*d.* sterling, and in 1843 bills from Spain were paid for 83,778 dollars 62 cents, and other charges; making altogether 167,818 dollars 34 cents, or 33,563*l.* 13*s.* 4*d.* sterling, besides which, on the 1st of January, 1845, bills drawn upon the government of Porto Rico by the Spanish government to the amount of 778,839 dollars 73 cents, or 155,767*l.* 18*s.* 11*d.* sterling remained unpaid, which will be paid off according to priority, as they may be able to spare the funds for discharging them, but several years must elapse before they can be all paid off, and

* Except Venezuela, Colombia, and St. Domingo, whose ships are not allowed to enter the ports of Porto Rico.

whilst the government at home draws so heavily upon the colony, it is impossible that they can appropriate money to any extent for improvements in roads or any thing else unless some internal tax be laid upon the inhabitants for the purpose, for what they now pay is very trifling.—*Official Returns, Porto Rico, 14th of January, 1845.*

REGULATIONS RELATING TO THE PAYMENT OF DUTIES IN PORTO RICO.

The productions of the island which have been shipped to foreign ports and are returned to be imported here, whatever may be the cause, must pay the same duties as are paid upon the productions of the country from whence they were last imported.

All articles entered for home consumption at Porto Rico, if exported to any other foreign port, shall be free of all duty on their exportation; but the import duties will not be returned.

If any vessel lands goods in small or large quantities in the roads, creeks, or bays in the island not allowed for that purpose, they with the vessel and all that belongs to her will incur the penalty of confiscation.

Sixty days are allowed by the customs for the landing and payment of the duties on goods from the date of delivery of the captain's manifest, the consignee being obliged to pay them at the expiration of that time, but if no consignee be found, the captain must pay them before he departs.

The duties on goods imported must be paid as soon as the return is made by those not entitled to a delay in the payment. One-fourth part of the duties required by the customs must be paid in gold or Spanish dollars, and the other three quarters in the Macaquino money or currency of the island.

The person answerable for the duties to whom an extension of time is granted for the payment, must give a note of hand payable at a fixed period for the sum of money to which they amount, and this note of hand must be endorsed by another person making himself liable for the payment in case the importer should not pay it. This permission extending the period for the payment of the duties is not, however, granted indiscriminately to every one, but the party claiming the credit must be a merchant and acknowledged as such by the Chamber of Commerce, to which he must in the first instance apply to be enrolled as a merchant, stating that he is in a situation to comply with their regulations, and upon their being satisfied of it his name is placed upon the list of merchants, and all others not coming under this description must pay the duties upon the goods they import directly.

The following are the regulations established relative to the payment of duties by such importers as are settled at Porto Rico as merchants, and subject to the Chamber of Commerce.

When the manifest value of the goods (supposing them to be foreign) does not exceed 200 dollars, the duty must be paid as soon as the return is delivered in by the landing officers. From 200 to 2000 dollars in value two months are allowed for the payment; from 2000 to 4000 dollars, three months; from 4000 to 6000 dollars, four months; from 6000 to 8000 dollars, five months, and on amounts exceeding that sum, six months, the Intendencia or Board of Revenue reserving to themselves the right of enlarging the last-named period for payment when the value of the cargo is considerable.

Spanish goods imported in a Spanish ship have an advantage over other goods in the fixing for the value, by which the period for the payment of the duties is regulated as they are taken 75 per cent lower than other goods. For instance, in the first class Spanish goods to the value of 50 dollars only, are required to pay the duty at once, whereas other goods to the value of 200 dollars must pay the duty directly; in the second class, Spanish goods to the value of 500 dollars only, have two months' credit, whilst other goods to the amount of 2000 dollars must pay their duties in two months; in the next class, Spanish goods to the amount of 1000 dollars have three months' credit, but other goods to the amount of 4000 dollars must pay their duties at the same period, and so on with the other classes.

The same credit is not allowed in the payment of the duties upon the exportation of the productions of the country as upon articles for importation, but they must be paid directly.

Spanish and foreign ships coming from abroad which may proceed from one approved port in the island to another, with the whole or part of their cargoes, shall be despatched with certificates referring to their manifests, and having on them the proper annotations of the goods landed at the first port (if any were landed), which must be produced at the port where they wish to discharge, going through the same formalities if they proceed to others as at the first port of entry, and paying at each the duties on that part of the cargo which may be landed there.

Foreign goods, which have paid the import duties, can be taken free by land or by water to all parts of the island with proper permits, without any necessity for the return of the permits.

The productions of the island can also be removed free from one port to another, but those who take them are obliged to deliver in returns of the permits.

Vessels coming from foreign ports to the island of Porto Rico ought to be careful in bringing a manifest with a clear specification of the contents of the cargo, with certificates of the shipment of the goods on board, signed by the Spanish consul at the port of shipment, if there should be one there, as they are very particular in requiring these documents in importing a cargo.

Tonnage Dues.—Spanish ships coming from the neighbouring islands pay five and a-half rials, or about two shillings and ninepence English, per ton; two rials, or about one shilling English, if from other foreign ports; and one rial, or about sixpence per ton if from a Spanish port.

Every ship under the American flag pays eight rials, or about four shillings English, per ton, and all other nations pay five and a-half rials, or about two shillings and ninepence English, per ton.

Every Spanish or foreign ship, although she may enter in ballast of the export a cargo, much or little, is subject to the whole duty of tonnage.

There is an addition also of one per cent upon all tonnage dues.

If Spanish or foreign ships proceed on their voyage from one port of the island to another, they pay the tonnage duty only at the first port.

Spanish or foreign ships which arrive in want of water or provisions, or to inquire the prices of goods, repair damages, or for other motives, shall not be charged any tonnage duty, but they must supply their wants as quickly as they can, and sail again from the port as soon as they are ready, taking care not to import any article, for if they do they become subject to the whole of the tonnage duty.

Anchorage and Harbour Dues.—Every ship coming to an anchor in the port is subject to a duty of two dollars for anchorage. The pilotage into San Juan is eighteen dollars, and there are besides the captains of the ports and interpreters' fees, the whole of the different charges amounting together to thirty-two dollars.

If a ship from abroad proceeds from one to other ports in the island, she must pay the anchorage and harbour dues at every port she enters.

Warehousing.—The port of San Juan is the only one in the island at present where foreign goods can be warehoused without payment of duty.

The goods are allowed to remain in bond twelve months, and when taken out two months more are allowed the merchants for the payment of the duties, provided, if Spanish goods, they are of the value of fifty dollars, or other goods of the value of 200 dollars, the duties must otherwise be paid when taken out of bond.

Goods warehoused without payment of duty, pay half per cent on the value on landing, which is paid by the importer, and half per cent on clearing, which is paid by the person who takes them out of bond, making together one per cent, which is the only charge, besides the expense of labour, landing, and shipping, and the goods are deposited in the government storehouses, which are fire-proof, and no charge is made for storehouse rent.

Regulations respecting the Coasting Trade of Porto Rico—The coasting trade, which was confined to particular ports, can now be carried on between all the ports in

the island. No coasting vessel, despatched from one port of the island to another, is allowed on her passage to touch at any foreign port unless driven there by bad weather, and then it must be carefully ascertained that the cargo she has on board is the same as that which she shipped, and in the event of its being different it shall be confiscated, together with the vessel.

The coasting trade can be carried on in Spanish vessels only.

If a coasting vessel happens to touch at another point distinct from that for which she was despatched, and wishes to discharge the whole or part of her cargo there, it may be allowed upon the captain exhibiting the permits or documents with which he may have been furnished at his shipping port, and after the goods are landed receiving through his agent the corresponding return of permits, and having the requisite annotations made on his despatch.

Trade between Porto Rico and the Island of St. Thomas.—The importation into the Island of Porto Rico of goods coming from the Danish Island of St. Thomas, and those near it, can only take place at San Juan, Mayaguas, Ponce, Guayama, Areibo, Fajardo, Naquabo, Aquadilla, Humacao, and Guayanilla, and in vessels which measure twenty tons.

Captains, when they leave St. Thomas, ought, before they take their departure, to have a manifest prepared giving the full contents of the cargo, with a full specification of the packages, boxes, &c., on board, and it should give the tonnage also of the vessel, and the person interested in the cargo should give the captain a sealed note for the head of the customs at the port to which she may be bound, expressing from whence the different articles, came and what each package contains, and certificates from the Spanish consul are required for the shipment of all the packages or there may be a difficulty in landing the goods, and at any rate no credit will be allowed upon the payment of the duties.

Particulars of the different Rates of Duties on Goods imported into Porto Rico.

A fixed duty of fifty-seven reals (Spanish money) on every quintal of *foreign* cordage imported in a foreign ship, thirty-four reals from foreign port in Spanish ship, twenty reals from Spanish port in Spanish ship.

In a Foreign Ship.

100	per cent	ad valorem	on	foreign salt.
40	"	"		foreign flour.
36	"	"		refined sugar from foreign ports.
26	"	"		oil, liquors, woollen goods, hams, lard, butter, furniture, paper, pastes, as maccaroni, &c., furriery, salt fish, cheese, anchovies (foreign).
20	,	"		cod fish, meats, and salt provisions, ironmongery, fruits, grain, cotton, thread, and silk goods (foreign).
4	"	"		jewellery of gold and silver from foreign ports.
2	"	"		ditto, ditto from Spanish ports.

In a Spanish Ship.

32	per cent	ad valorem	on	foreign flour.
18	"	"		refined sugar from foreign ports.
24	"	"		oil, liquors, woollen goods, hams, lard, butter furniture, paper, pastes, as maccaroni, &c., furriery, salt fish, cheese, anchovies (foreign).
14	"	"		cod fish, meats, and salt provisions, ironmongery, fruits grain, cotton, thread, and silk goods (foreign).
11	"	"		leeches from a Spanish port.
6	"	"		fruits, and goods, and merchandise from a Spanish port.
3	"	"		jewellery from foreign ports in Spanish ships.

Free.—Gold and silver in bullion and coined, steam-engines, and other machinery for the use of sugar-mills.

There is a duty of *one* per cent upon the *value* of the goods, also for making roads, and there is a duty called the balance of one per cent on the *amount of the duties*, and *one-quarter* per cent consulage upon the *value of the goods*, in addition to the above duties.

The war duty, a temporary tax, was taken off 1st of October last. It was a tax amounting to 500,000 dollars, imposed upon the island by the government of Spain, the 30th of January, 1838, to pay the expenses of the war.

The articles prohibited from importation are gunpowder and fire-arms, which can be only admitted under special permission.

Three-fourths of the duties to be paid in the Macaquino money of the country, and one-fourth in gold or Spanish dollars, both on exports and imports.

*Particulars of the Duties on Exportation of Produce, &c., from Porto Rico.
In Foreign Ships.*

20	per cent ad valorem	on valuable woods and building timber to foreign ports.
5	" "	spirits, cotton, hides, molasses, tobacco, and the other productions of the island, except cattle and wood.
2	" "	silver in bullion and coined, for foreign ports.

In Spanish Ships.

12	per cent ad valorem	on valuable woods and building timber to foreign ports.
4	" "	ditto, ditto to Spanish ports.
3	" "	spirits, cotton, sugar, coffee, hides, molasses, tobacco, and the other productions of the island, except cattle and wood to foreign ports.
1	" "	spirits, cotton, hides, molasses, tobacco, and the other productions of the island, except cattle and wood to Spanish ports.
1	" "	gold in bullion and money to foreign ports.

The Duties on the Exportation of Sugar and Coffee from this Island.

Those duties will henceforth be as follows, viz. :—

Three rials (round money) upon every case of sugar of four hundred pounds weight, in a foreign ship.

Two rials (round money) on the same quantity exported in a Spanish ship.

Four per cent on the value of coffee exported in a foreign ship.

Two ditto, ditto, ditto Spanish ship.

Free.—Gold and silver in bullion and money to Spanish ports.

The duty on cattle was taken off by the government of Porto Rico on the 19th of November last.

TRADE BETWEEN THE UNITED KINGDOM AND CUBA AND PORTO RICO.

THE exports of British manufactures to Cuba was carried on to a very great extent before 1809, when they were absolutely prohibited by law. Since that period the trade had increased in proportion.

DECLARED Value of British and Irish Produce and Manufactures, Exported from the United Kingdom to Cuba and Porto Rico, in each Year from 1827 to 1846. A small part of these Goods were Exported to some of the other Foreign West Indies, Hayti excepted.

CHAPTER XVIII.

FRENCH WEST INDIES.

FRANCE possesses in the West Indies exclusive of Cayenne, or French Guayana, the Islands of Guadaloupe and Martinique.

These possessions have for some time engaged most laudable attention, especially with reference to the slave population, on which subject great merit is due to the Duke of Broglie.

Guadaloupe consists of two islands, divided by Salt River, about five miles long, and twenty to forty fathoms wide, with sufficient depth for vessels of from forty to sixty tons. The eastern is called Grande-terre, western Basse-terre, or Guadaloupe; both about 534 square miles, or 341,760 statute acres; length of Grande-terre thirty-six miles, breadth of ditto twelve miles; length of Basse-terre thirty-five miles, breadth of ditto eighteen miles. Basse-terre is covered with mountains and hills of volcanic origin; the highest part, near the southern extremity, has a volcano, La Souffrière, rises to the elevation of about 5108 feet. It has no regular crater, but smoke issues out of three or four places. Not far from the

sea, south-west of the volcano, a spring rises out of the sea of boiling hot water. It is well watered by springs and rivers. Grande-terre is generally low, in few places above 1000 or 1500 feet high. It is not of volcanic formation, the elevated hills consist chiefly of coral rocks; it has neither streams nor springs of fresh water and the soil is sandy, and much less fertile than Basse-terre. Point à Pitre is built near the southern entrance of the Salt River, on low ground; the harbour of Le Petit Cul de Sac is sheltered, and the anchorage is good. Population about 16,000. Basse-terre, Guadeloupe, is built within an unsheltered roadstead, with indifferent anchorage. It is unsafe during the hurricane season. The town extends along the shore, but not far inland, owing to a mountain rising almost abruptly from the shore. It is well built, and is situated in the more productive part of the island. Population about 7500.

MARIE GALANTE is about twelve miles long, and five to nine miles wide; area sixty British square miles, 38,400 acres. The hills towards the southern extremity are of no great elevation, and are covered with trees; on their summits there is generally a verdant plateau. In the northern districts, the hills rise higher; and towards the eastern coast, they terminate near the sea in high and precipitous rocky cliffs. Parallel to the low northern shores there extends a narrow lagoon about eight miles long, separated from the sea by a narrow bank of sand, The capital is GRANDBOURG, a small, but neat place.

Within these mountainous rocks, nine miles south-east of Basse-terre, called *Saintes*, there is a safe harbour. The *Saintes* consist of lofty and steep peaks, some of which are united by flat ground, and ridges of inferior elevation; others are entirely separated by the sea. The products are coffee and cotton.

DESEADA, or DESRADÁ, a small island two leagues east of Guadeloupe rises with a steep ascent, and then spreads into a tableland of limestone rocks, in which caverns occur. It is without water.

The population of these islands on the 21st of December, 1836, consisted of males, 60,794; females, 66,780, total, 127,574.

Of the above there were—

PROVINCES.	Free.	Slaves.	TOTAL.
	number.	number.	number.
In Guadeloupe.....	26,168	81,642	107,810

Total.....	31,252	96,322	127,574

Average proportion of births and deaths to the population—one birth for every fifty slaves, twenty-eight free; one death for every forty-four slaves, thirty-four free.

The average quantity of rain that falls in the year is calculated at about eighty-six inches. The difference in the quantity, between a dry and wet season, is about thirteen inches. In the course of the year, the greatest number of days

on which rain falls, during five years was, 223, and the smallest number 179. The greatest quantity of rain falls from the middle of July to the middle of October; the remaining nine months are comparatively dry.

The area of Guadaloupe and its dependencies is constituted as follows in English acres: Guadaloupe, 339,160 acres; Marie Galante, 37,900 acres; Saintes, 3102 acres; Desirada, 10,695 acres; St. Martin (French part), 13,266 acres; total, 401,123, or 631 square miles.

GUADALOUPE and its dependencies are divided into three arrondissements, six cantons, and twenty-four communes (part of the island of St. Martin which lies to the *northward* of St. Christopher, forming one of the latter).

The two small rivers, the Goyave and the Lezarde, are navigable for boats, and facilitate the shipment of produce.

The productions of these islands are, sugar, molasses, rum, coffee, cotton, cocoa, and small quantities of cloves and tobacco. The quantities of these articles produced in 1835 were:—Sugar 79,937,530 lbs.; molasses, 1,431,384 gallons; rum, 474,763 gallons; coffee, 2,209,618 lbs.; cotton, 177,020 lbs.; cocoa, 61,649 lbs.; cloves, 759 lbs.; tobacco, 8310 lbs.

The government of Guadaloupe and its dependencies is vested in a governor, a privy council composed of six members, three of whom are appointed *ex-officio*, and a colonial council of thirty members, elected by the owners of landed property in the island. The metropolitan interests of the colony are intrusted to two delegates in Paris, who are elected by the colonial council, and form part of the colonial committee of seven members, who advise with the central governments. The internal affairs are managed by municipal councils.—(*See Martinique.*)

MARTINIQUE.—The French geologists class Martinique with those islands which are entirely of volcanic formation. Masses of volcanic rocks rise in the interior to a great elevation. Mount Pelée is nearly 4450 feet high, and the summits of Les Pitons-de-Carbet, are said to be higher. Six extinct volcanoes occur, the craters of one of which is of vast breadth and depth. The volcanic rocks extend in most parts from the mountain to the sea; which latter form numerous and deep indentations along the coast. Between the volcanic rocks irregular broad fertile valleys occur. About two-fifths of the surface of the island is under cultivation, and the remainder is covered with trees, or occupied by naked rock or disintegrated pumice-stone. When the latter is mixed with mould, both constitute a most fertile soil. The mountain slopes are in

most parts covered with primeval forest. In other parts the slopes are cultivated to the height of about 1400 feet perpendicular. Numerous streams flow down from the mountains. Near the southern end there is a small salt lake. This island produces sugar, coffee, cocoa, and cotton. The valleys on the west side, or Basse-terre, are more extensive, fertile, and level than those in the eastern called Cables-terre. Of the numerous harbours, Cul de Sac Royal is an admirable port, on the shores of which stands Fort Royal, the residence of the French governor. Population about 10,000. The CAPITAL is ST. PIERRE, the largest and best built town in the Lesser Antilles. The houses are four to five stories high, built in the style of European architecture. The streets are regular, and the shops are numerous and well supplied. Population about 20,000. Small streams run down the centre of the paved streets, which are lighted at night by lamps. It has some churches, a botanic garden, and is strongly fortified. Fort Trinité, on the eastern coast, stands in the bay of the same name. It has a considerable trade. Population about 6000. There are many other harbours, but they have, on the east side especially, intricate entrances.

The number of the population of Martinique in 1836 was as follows :—

Free males, 17,419; females, 20,536; total, 37,955. Slaves, males, 37,584; females, 40,492; total, 78,076. Total, free and slaves, males, 55,003; females, 61,028; total, 116,031.

The whites are not distinguished from the free black and coloured persons, but it is estimated that they amounted to about 9000, and that of the other 29,000 free persons, 17,579 had been manumitted in the five preceding years, and from 1836 to 1842, there were manumitted 3534 slaves.

The proportions of births, deaths, and marriages, among the different classes of the population are:—

Births, whites and free black and coloured, 1 in 29; deaths, 1 in 37; marriages, 1 in 137. Slaves, births, 1 in 32; deaths, 1 in 35; marriages, 221 in 5577.

The climate is humid. From observations during six years, the greatest number of rainy days in the year was 238, and the least number 223. The quantity of rain which falls during the year averages eighty-four inches; the difference between a dry and a wet year does not exceed thirteen inches. The greatest rains fall between the middle of July and the middle of October; during the other months showers are frequent. The heat is tempered by the sea breezes.

The area of Martinique is estimated at 98,782 hectares, or about 244,348 English acres; one-third computed as level, and two-thirds as mountainous. Some of the rivers or streams are navigated by boats for a short distance.

Great improvement in the culture of the sugar-cane has taken place in this island of late years, and in 1835 it was estimated that 38,320 hectares were under

culture, that savannah and pasture lands occupied 21,772 hectares, woods and forests 23,387 hectares, and unproductive lands 15,303 hectares.

In 1836 there were three earthenware and tile factories, and ten lime-kilns, employing 352 slaves; and a number of hands, both free and bond, are employed in fishing; and between 400 and 500 in navigation and the coasting trade.

OFFICIAL Account given of the Distribution of the Cultivated Lands, their Produce, &c., in 1836 :—

ARTICLES.	Hectares cultivated.	Produce.	Quantity.
	hectares.

Cotton.....	249	..	18,705 do.
Cocoa.....	464	..	125,610 do.
Corn, &c.....	12,706	..	Value 2,886,631 francs.
Mulberry.....	4		
Total.....	40,117		

On which 55,421 slaves were employed whose value is estimated at 1500, and 1000 francs each.

On the 1st of January, 1836, the number of beasts of burden and other stock upon the island was 38,034, valued at 12,324,230 francs, or 513,509*l.* 11*s.* 8*d.* sterling.

The number of mills employed in the manufacture of sugar was, in 1826, water-mills, 183; wind, 27; cattle, 211; total 421: in 1834, steam, additional 13; total, 434.

Martinique is divided into the arrondissements of Fort Royal and St. Pierre, fourteen cantons and twenty-six communes. It has a military force of about 2000 men, besides a militia of about 4000. There are three schools of mutual instruction, two in the capital, and one at St. Pierre, and there are primary schools in every commune, orphan asylums, and other charitable institutions.

The public expenditure of the island, in 1837, was estimated at 4,387,866 francs, the receipts to meet which amounted to only 2,260,711 francs. The difference falls on the French treasury.

Justice is administered by a court royal, two assize courts, and two inferior tribunals. Besides the towns already named there are Marin, with 3000 inhabitants; Lamentin, with 8900 inhabitants; and Rivière Salée, 2300 inhabitants, There are also about twenty villages in the island.

Fort Royal is the seat of government, and St. Pierre the maritime capital.

Government.—The administration is under a governor and a privy council of seven members. A colonial council of thirty members is elected for five years, by whites paying 300 francs, or 12*l.* per annum direct taxes, or possessing property in the colony worth 1200*l.*; it authorises the levying of taxes for internal purposes; advises the governor and privy council in all matters which it considers useful to the colony. The colonial council elects two agents to represent the colony in Paris, and to form part of a committee of agents for all the French colonies.

STATISTICS OF THE FRENCH WEST INDIES.

French Guyana, population, Canton of Cayenne, 3854 free; 14,941 slaves; total, 18,795 inhabitants. Canton of Senamary, 1202 free; 1651 slaves; total, 2853 inhabitants. Total population, 5506 free; 16,592 slaves; total, 22,098

CHAPTER XIX.

DUTCH WEST INDIES.

SAINT EUSTATIA.—This small island was first settled by the Dutch in 1635. It is nearly thirty miles in circumference, and its area is said to be nearly 190 square miles. It appears, at some distance from the sea, like a conical mountain; but it changes its appearance on approaching its shores, with a level surface for several miles, covered with some cane fields and provision grounds. Its town, during the war, carried on a contraband traffic to an extent which perhaps has never been surpassed; the plunder which fell into the hands of the English, when taken by Admiral Rodney in 1781, amounted to about 4,000,000*l.* sterling. The prosperity of this island has rapidly declined; little commerce is now carried on. The expenditure of the local government exceeds the revenue. The island has no water except that supplied by rain. It is reputed healthy.

There are very few sugar plantations, producing about 1000 barrels; yams, and a few other articles of food are raised.

The population, at one period, amounted to about 5000 whites, and about 15,000 slaves; the present number does not exceed 300 or 400 whites, and about 2000 slaves.

SABA lies about ten miles to the north-west of St. Eustatia. It is inaccessible excepting on the south side, where an artificial path admits the ascent of one person at a time. In a secluded valley, in the middle of the island, there are a few in-

habitants, who grow some cotton and vegetables. It is a dependency of St. Eustatia.

ST. MARTIN.—The French and Dutch made a settlement on this island in 1638, from which they were expelled by the Spaniards: the latter abandoned it in 1650. The French and Dutch divided it between them. It is about fifteen miles in length, breadth, nine miles; area, thirty square miles.

This island is hilly, but has no mountains; it is watered by several rivulets; in the southern part are salt water lagoons, from which great quantities of salt are obtained by the Dutch. The coast affords several good roadsteads, of which Philipsburg and Marigôt are the chief. The soil is light, stony, but fertile, especially in the northern district: excellent tobacco is grown. The climate is considered healthy.

The northern and largest portion of the island, belonging to the French, forms a *commune* of the colony of Guadaloupe. The population of this division is estimated at about 600 free, 3000 slaves.

The southern division, though less fertile, is more valuable for the salt it produces. It also yields annually about 25,000 cwt. of sugar, and 130,000 gallons of rum. Its expenditure, in common with all the Dutch colonies, exceeds its income.

The population of the Dutch has been estimated as equal to that of the French part.

CURAÇOA.—This island was settled by the Dutch in 1632. Its length is about forty-two miles, and about fourteen miles in breadth, with an area of nearly 800 square miles.

It is generally low, with several hills rather than mountains. It has in most parts a bold sea-coast, with some good harbours, the first of which is Santa Anna. The soil is sterile and rocky: the industry of the inhabitants have brought a considerable quantity of land under culture. Sugar is the chief staple, and salt is also made. From its vicinity to the South American coast, it was formerly a place of great contraband trade. Williamstadt, the capital and seat of government, is one of the cleanest and best built towns in the West Indies. The government is vested in a stadtholder and a civil and military council. According to official statements, the expenditure exceeds the revenue of the colony, the former amounting to 408,903 francs, and the latter only to 57,847 francs, 53 cents.

Population, about 3000 whites; 5500 free coloured; 5000 slaves.

CHAPTER XX.

DANISH WEST INDIES.

ST. THOMAS.—This island, which was settled by the Danes in 1672, is in length about ten miles; in breadth, five miles; area, about thirty-seven square miles. A chain of hills traverses the island from east to west. The soil is generally poor; water is scarce, and the island is subject to severe droughts. Sugar and cotton are grown in moderate quantities. The town is well built, situated on the acclivities of three conical hills; near these it is defended by strong fortresses, commanding the harbour and shipping. The general aspect of the place is said to present a superiority over many of the towns in the lesser Antilles, and as resembling a populous commercial town in Europe. The houses are principally built of stone and brick, and tiled. St. Thomas has long been, and is now, a principal emporium in the West India. Its convenient situation, its spacious and safe harbour, and the moderation of the import duties, which vary from 1 to $1\frac{1}{4}$ per cent, *ad valorem*, have, in consequence, rendered it a *dépôt* for the supply of the neighbouring islands; goods being sent to it as an entrepôt, until sold to other markets. Commerce and activity pervade its streets, and shipping of many nations are always in its harbour. The articles of importation are manufactured goods: principally from England, and partly from other countries of Europe; and provisions, lumber, &c., from the United States.

The import trade of this island in 1840 from Europe and North America was as follows:—

P L A C E S.	Vessels entered.	Tonnage.	First Cost Value of Importation.
	number.	tons.	dollars.
From Great Britain.....	42	9,208	2,100,000
France.....	38	6,944	640,000
Spain.....	7	520	23,000
Italy.....	9	1,288	53,000
Hamburg and Altona.....	32	5,890	560,000
Flensburg.....	12	2,265	41,000
Bremen.....	9	1,432	199,000
Holland.....	2	106	13,000
United States & Brit. America	217	30,279	968,000
Total.....	368	58,132	4,997,000

In the same year the Spanish American and West Indian Islands' arrivals were as follow:—

P L A C E S.	Vessels.	Weight.	P L A C E S	Vessels.	Weight.
number.	tons.		number.	tons.	
Venezuela and New Grenada...	55	4,642	Brought forward.....	1186	32,005

Dutch ".....	99	3,148	Total.....	1568	48,024
Carried forward.....	1186	32,005			

Besides a great number of vessels which call, neither load nor unload goods, and, in that case, free from port charges.

Population about 7000; of whom there are about 500 whites; 1500 free coloured and negroes; and the remainder slaves.

SANTA CRUZ, OR ST. CROIX.—This island was first settled by the Dutch in 1643, who were expelled by the English in 1646. In 1650, the English were routed by the Spaniards, who laid the island waste. In 1733, the French crown sold its claim to the Danes for 75,000*l*. In 1801 it was taken by the English; restored in the following year; captured in 1807, and remained under the dominion of Britain till 1815, when it was again ceded to the Danes.

Its length is about twenty miles; breadth, about nine miles; area, about eighty-one square miles.

Santa Cruz is of an oval form; inferior to St. Thomas in its maritime commerce, it is of far greater importance in area, fertility, products, and internal resources. With the exception of a few hills in the neighbourhood of the capital, the whole island is nearly a level. Its surface was originally divided into equal portions of 150 acres each, which, with different shades of culture, gives a varied aspect to its area: the roads are good, and average from twenty-four to thirty feet wide; they run in straight lines through the island at right angles.

The soil is not very rich, but tolerably fertile, yet owing to droughts the crops are uncertain. Christianstadt, the capital, is extremely well built; the houses are of stone, and commodious.

The government of the island is under a governor-general, whose jurisdiction extends to the other Danish colonies in these seas, and two councillors:—there is also the “Burgher Council,” consisting of seven members. The code of Christian V., together with the rescripts of the crown, constitute the law. A number of the largest estates in the island are the property of British subjects; about one-third of the slaves belong to the King of Denmark, as owner or mortgagee of estates; but the slaves are in the course of annual and gradual emancipation, as is the case in the other Danish islands.

Population in 1841—3200 whites; 20,000 slaves.

In 1816, the island produced upwards of 40,000 hogsheads of sugar, but in seasons less favourable, not more than 10,000 or 12,000. The cultivation of coffee, indigo, and cotton, has been generally abandoned for many years.

Average value of Sugar, about	1,200,000 rix dollars.
„ Rum „	500,000 „

ST. JOHN.—This island was settled by the Danes in 1721. Its length is about thirteen miles; its breadth, six miles. Sugar and cotton are produced in small quantities, and live stock is also reared. On the south-east side, a pro-

montory forms two coves, which are defended by a fort on the north point of the entrance, and another on Duck Island, close to the south point. This promontory has the town called "the Castle."

ST. BARTHOLOMEW.—This island belongs to Sweden. It was settled by the French in 1648 ; ceded by them to Sweden in 1784. Its length is about fifteen miles ; its breadth, about five miles ; area, only twenty-five square miles. St. Bartholomew is of slight elevation, with irregular round hills. It is well wooded, but indifferently supplied with water. The inhabitants depend chiefly on rain-water. The soil is fertile, producing sugar, cotton, and some tobacco ; the woods yield *lignum-vitæ*, iron-wood, and other trees. Reefs surround the coast, but there is a good harbour on the west side called the *Carenage*, near which the town of Gustavia is situated.

The population of the whole island is estimated at between 6000 and 7000 ; many are descendants of Irish Roman Catholics.

BOOK IX.

EMPIRE OF BRAZIL.

CHAPTER I.

DESCRIPTIVE SKETCHES AND STATISTICS OF BRAZIL.

WE have in the first and third books of this work introduced a sketch of the discovery and history of Brazil.

This empire comprehends the great eastern section of South America; from the sources of the Rio Branco, in about 4 deg. north latitude, or rather from the boundary of French Guyana, to the boundary line of Uruguay in about 30 deg. south latitude.* The length of the empire of Brazil is computed, from north to south, at about 2600 miles. The greatest breadth, from between 6 deg. and 8 deg. south latitude, on the Atlantic Ocean about 35 deg. west longitude, to the Rio Yavari (70 deg. west longitude) is estimated at near 2540 miles. The area is estimated at about 2,750,000 square miles, or nearly twenty-three times the area of the United Kingdom, and about seventy times as large as Portugal.

The boundaries will be best seen by reference to the last modern maps than by description; further than that its boundaries, which are not, except on the Atlantic, well defined, are, French Guayana on the north, the Atlantic on the east and north-east, Uruguay on the south, and the Spanish Republics along its great western frontiers.

The northern and western provinces of Brazil consist of vast alluvial plains of great fertility, with, in many parts, an unhealthy climate, arising from the rich vegetation of low, alluvial lands. The central, eastern, and southern provinces vary greatly, both in climate and in products; some regions are not inferior in fertility to the most favoured parts of the earth, others are either completely arid or nearly unproductive. The whole of the southern and eastern provinces may be considered as one great plateau, which rises somewhat abruptly from the Atlantic, and extends westward with undulations, and hills, and rivers, and streams, several hundred miles, with gradual declivities towards the north and south. The highest part of this great plateau rises into a chain of mountains, which run parallel to the coast and east of the River San Francisco. This region

* A strip of the country east of Monte Video, along the Atlantic, is with its islands and lagoons claimed as far as 35 deg. south, by Rio Grande do Sul.

is called the Serra do Espinhaço, or the Backbone Chain. There is, however, very generally a belt of low land between the sierra and the ocean.

Sea Coast.—Approaching the coast from the Atlantic, the outline appears mountainous, but on nearing the shores it generally presents a picturesque character, varied by mountains, forests, and verdant valleys. The lands rise, however, rather abruptly (some few miles) from the coasts, and afterwards to the high ranges, from 5000 to 6000 feet high, called the Brazilian Andes. The approach to Rio Janeiro, with the Organ mountains in the distance, the coast of Brazil north of Rio Janeiro, or rather north of Cape Frio, which stretches out into the Atlantic, east from the Bay of Rio Janeiro, is remarkably picturesque but not remarkable for projecting headlands.

Cape Frio is the great landmark for ships arriving from the Atlantic for Rio Janeiro. This promontory is one of the termini of the long ridge of mountains, which follows the coast to the south and west. Mr. Kidder observes, that “a huge oval mass of granite here marks the spot where the line of coast turning to the north, forms nearly a right angle.”

Some years ago the English frigate *Thetis*, bound homeward at the expiration of a cruise in the Pacific, was wrecked upon Cape Frio. This vessel, on leaving the harbour of Rio where she had touched, had encountered foul weather. After struggling against it till it was presumed she had cleared the coast, she bore away, steering the proper course, if sufficiently east. In the darkness of the night, with the wind fair and strong, the ship was running eight or ten knots an hour, when, without the slightest apprehension of danger, she dashed upon this rocky headland. The officers and crew had barely time to clamber on to, or drag themselves up, the promontory, before the frigate sunk. The crew managed to hold on the rocky shelves of the cape, above the reach of the waves, throughout a most dismal night.

A good lighthouse has since been constructed upon Cape Frio, which at the present time renders the approach of the navigator nearly as safe by night as it is by day.

From Cape Frio the coast to the north is low and sandy. About ten miles from it is a village which, in 1615, received the name of the city of Cape Frio. It does not thrive nor increase, though it has a safe harbour and fertile land, with sea-marshes yielding salt.

The next place to the north is Macahé, at the mouth of a small river. The steamers which ply between Rio de Janeiro and Campos, touch at the village of Cape Frio and at Macahé. The fertile district surrounding Campos is called the Campos dos Goyatakazas, or plains of the Goyatakaz Indians. It has been compared to the Elysian fields. Campos, situated on the western bank of the river, has regular and well-paved streets, with some good houses. Its commerce employs a vast number of coasting smacks, which export its sugar, rum, coffee, and rice to Rio Janeiro. The sugars of Campos are deemed the best in Brazil.

The coast of Espirito Santo, which embraces the old captaincy of the same name, and part of that of Porto Seguro, extending from the province of Rio de Janeiro on the south, to that of Bahia on the north, was discovered by Cabral, and settled by the first *Donataries*. It is but thinly inhabited and worse cultivated. Its soil is fertile, and well adapted to the growth of sugar-cane and other tropical productions. Precious woods and drugs abound in its forests, and the shores abound in excellent fish. A company has surveyed the Rio Doce, with the view to open a transport between the coast and the province of Minas Geraes.

The Abrolhos (in Portuguese, *open your eyes*) are four small, rocky, low, and dangerous islands, about ninety miles from the shore, in the eighteenth degree of south latitude. They are a projection from a bank of rocks, which exhibits itself, occasionally, between the seventeenth and twenty-fifth degrees of south latitude, at a distance of from two to ten leagues from the main land. Besides these shoals, there is a regular reef of rocks running near and generally parallel with the shore from Cape Frio to Maranham. Espirito Santo, Porto Seguro, Ilheos, and nearly all the ports along the coast are entered by openings through this reef. This long reef protects vessels sailing within it so effectually that it has been compared to one continued harbour. The sandhills along the shores of Brazil often rise in high white hummocks.

The distance from Rio de Janeiro to Bahia is about 800 miles. There is no large city or flourishing port on the coast, nor is there a single direct or beaten road through the interior. The only author who has ever travelled over this portion of Brazil, by land, is Prince Maximilian, of Neuwied. It is difficult to form an idea of the impediments, annoyances, and dangers which he had to surmount:—such as dense and thorny vegetation, insect plagues, among which were the most formidable wasps' and hornets' nests, wild beasts, venomous reptiles, and rivers without bridges. Yet he tells us that "although scratched and maimed by thorns, soaked by the rains, exhausted by incessant perspiration caused by the heat, yet nevertheless the traveller is transported in view of the magnificent vegetation." His travels in Brazil were accomplished between the years 1815 and 1818, and his interesting work furnishes up to the present day the best account we have of the scenery and of the people of this part of the empire. The character and condition of the inhabitants have not since then been susceptible of much either of progress or change. Under the present administration, there has been a gradual improvement; yet, up to 1839, the whole province of Espirito Santo contained not a single printing-press. Many of its churches, built with great expense by the settlers, were going to decay. Nothing was doing towards civilising or instructing the Indians; and, amidst a population of more than 40,000, there were only six or seven primary schools with any pupils.

On approaching Bahia and the Island of Itaparica, the coast is low, and

little can be seen, save here and there a line of branching coqueiros (cocoa-nut trees). The latter are often seen along the coast as far south as Santa Catherina.

From Bahia to each of the provinces of Sergipe and Alagos, the coast is generally low, but in parts undulated, with a thick jungle covering the country to the serra of Itaparica, about twenty miles inland. The serra divides the low country from the open plains of the interior. Brazil-wood abounds in the serra. Porto dos Pedros, Barra Grande, and Porto Calvo, occur on the coast of Alagos. The shore continues low, with white sandhills to and at Pernambuco and Itamarca, and often covered with cocoa-nut trees. The coast of Rio Grande do Norte is also generally low, with a sandy beach, and the soil sandy, and only in parts fertile. The coast, after rounding Cape St. Roque, trends westward, with shores generally low, and with some peaks inland in the province of Ceara. The coast of Maranhão is more irregular but not mountainous. From Maranhão to the mouth of the Amazon, the shores, including the Delta, are, with little exception, flat and uninteresting. The whole coast of Brazil north of Rio Janeiro, may be considered generally as low, and faced at some distance in the sea with reefs or banks, yet from a distance of some leagues at sea, its appearance, for a very great extent is mountainous. From Cape Frio to Rio Janeiro, the shores form an exception to this rule. South of Rio Janeiro, rivers, bays, and the large lagoons of Patos and Merim occur; and, with a high mountainous background, the coast, generally, with a few bluffs, is also low.

CHAPTER II.

LAKES AND RIVERS OF BRAZIL.

LAKES are numerous in the great basins, or plains, of the Amazon, and some are of considerable extent during the rainy season. The Lake of Xarayes exists only during the wet season, when it covers many thousands of square miles; in the dry season its waters entirely disappear. There are numerous lakes in the southern provinces of the empire in the low country bordering Uruguay; the largest is the Laguna dos Patos and Lake Mirim. The greatest part of Lake Mirim is included within Uruguay. No lake of any extent occurs on the great table-land, small lakes are not uncommon. But no deep or extensive lakes like the great inland seas of North America occur in Brazil.*

* While we are too well aware that the most careful writers do not escape making erroneous statements, and one writer after another has related some general errors respecting Brazil, the recent work of Mr. Kidder, being from the evidence of his personal knowledge down to 1844, has appended the following remarks:—

“It was not until the present work was in press, that the attention of the author was directed to the article on Brazil, in M'Culloch's Universal Gazetteer in that work.

“1. Three Provinces are enumerated which have no existence in the empire, to wit, Rio Negro, Minas Novas, and Fernando.

“2. Two of the actual provinces, Santa Catharina and Rio Grande do Sul, are not in the list at all.

“3. ‘All its principal cities are on the coast. Its HARBOURS are among the finest in the world,

All the tributaries of the Amazon, which flow into it, east of the Rio Madera, from the south, run their whole course within the territories of this empire. Of the tributaries which fall into the Amazon from the north, between the mouths of the Madera and Guyana and that of the Yavari, the lower part of their courses only flows through Brazil. The rivers which drain the southern portion of the table-land carry their waters down to the Parana and Paraguay. Most of the larger rivers which fall into the Amazon from the south-east, and those which flow into the Parana, have their course interrupted by rapids, and cataracts. These rivers are generally, however, navigated, *portages* occur where the impediments are too great to be overcome. Those rivers which do not join either the Amazon or the Parana, and navigated to some extent, are chiefly the Itapicurú, the Parahyba, and the Iguaribe, west of Cape San Roque; and south of it the Rio San Francisco, the Rio Grande do Belmonte, the Rio Doce, the Parahyba, and the Rio Grande do Sul with its branch, the Jacuhy. But with the exception of the Amazon, the rivers of Brazil flowing to the coast are interrupted in their navigation.

The great range of mountains near the coast prevents any rivers from attaining the ocean immediately, except such as spring from the eastern side of serras; but several rivers of the interior fall circuitously into the Atlantic.

and are connected with the interior by numerous large RIVERS, most of which are *navigable for a considerable way inland.*'

"The harbours of Rio de Janeiro and Bahia deserve the above compliment. But what great navigable rivers connect either of them with the interior, remain to be discovered. It is matter of notoriety, and of universal regret, that, notwithstanding the number and the vastness of the rivers flowing through the northern and western portions of the empire, and finally mingling their waters with the Amazon and the La Plata, there is not one, besides the Amazon, emptying into the Atlantic along the whole Brazilian coast, which is 'navigable' any 'considerable way' from its mouth inland. Hopes are entertained that the River Doce may be rendered navigable to steamboats, but great expense must first be incurred. *No city or harbour of note exists at its mouth.*

"4. 'The soil near the coast displays evidences of the *richest cultivation.*' 'In the neighbourhood of Rio Janeiro, it consists in a *great measure of plains.*'

"No part of Brazil has been, as yet, subjected to 'the richest cultivation,' and probably three-fifths of the whole sea-coast are, as yet, in a state of nature. If it is meant that the coast generally has been more cultivated than the great interior, it is in the main true, although it may be questioned, whether any part of the coast has been better cultivated than some portions of Minas Geraes. To speak of the soil in the neighbourhood of Rio, consisting 'in a *great measure of plains,*' is still more obviously incorrect, as will appear from any authentic description or view of the place.

"5. Under the head of RELIGION, it is stated that one of the *chief* sects at Rio is that of the Sebastianists. It is but just to say that this was never true. Individuals there are in that city, as well as in other parts of the empire, belonging to that sect, but they are nowhere numerous, and have not been during the present century.

"6. Respecting POPULATION, it is stated on the authority of Balbi, that there are 300,000 converted Indians. Probably no intelligent Brazilian would estimate the number higher than 10,000, making the most charitable allowances. Again, on the same authority, it is stated that the 'independent Indians, European settlers,' &c. (singular conjunction), amount to 150,000; whereas, there is reason to believe that the province of Pará alone contains that full number of savage Indians.

"Mr. McCulloch's view of literature, education, &c., would have been tolerably correct twelve or fifteen years ago, if we except the absurd and malicious statement, that 'the book called 'the art of stealing' is found in nearly every house in Brazil!'

"The radical defect of the whole article under observation consists in its having been compiled from books that are either obsolete, or else that were never entitled to credit."—*Kidder's Sketches of Brazil.* New York, 1845.

The Paraiba discharges itself in latitude 6 deg. 57 min. south ; longitude 42 deg. west.

There are three Rio Grandes : one rises in the province of Minas Geraes, and, after a long course to the north-east, falls into the Atlantic a few miles north of Porto Seguro, in latitude 15 deg. 26 min. south ; another waters the province of Bahia, and falls into the Rio Francisco ; a third gives a name to the province of Rio Grande do Sul, and flows in the Atlantic about the 32nd parallel of south latitude.

The immense estuary of La Plata is the great drain for all the central waters south of the tributary streams of the Amazon. The land which divides the waters of the Amazon from those of the Plata, rises to its greatest height between the 13th and 14th parallels of latitude. The Paraguay, Parana, and other tributaries of the Plata, we have described in Book III.

THE RIVER AMAZON.

THE AMAZON, which, with its tributaries, is considered the largest river in the world, assumes its name at the junction of the Tunguragua, or Maranon, which issues from the Lake Lauricocha, in Peru, in latitude 10 deg. 29 min. south ; and the Ucayali, formed by streams which have been traced to the 16th and 18th degrees of south latitude. These two great and navigable rivers unite on the confines of Peru, and form the main and uninterrupted stream of the Amazon, which, running eastward more than 1000 miles, then takes a more northerly direction, and having received the waters of hitherto countless and navigable tributary streams, falls into the Atlantic by many channels. Following all its windings, it is computed to be between 4000 and 5000 miles in length. At its mouth, it is about 180 miles broad, and its depth is in most parts unknown. It has been navigated to its confluence with the Pachitea, between the 8th and 9th degrees of south latitude, where its current is gentle ; and, by the Rio Negro, one of its branches, it communicates with the Cassiquiari, which falls into the Oronoco. Its shores are covered with dense woods, inhabited by tigers, leopards, boars, and an innumerable variety of apes or monkeys, while an immense variety of birds of the most beautiful plumage enliven these vast solitudes. The manati and tortoise abound along the banks of this river and its tributaries, which also swarm with alligators. That huge herb feeding animal, the manati, ascends or is found, as well as the turtle, high up the Ucayali.

The principal stream of the numerous magnificent rivers which fall into the Amazon, is the Rio Madera, or forest-river, formed by the union of several streams issuing from the eastern slope of the Andes on the borders of Peru, which flowing towards the east and north-east, unite before they reach the 10th degree of south latitude. Their confluent waters, after several magnificent falls, reach the level country ; whence the Madera rolls along, its vast waters, forming, for a great

part of the distance, the north-western boundary of the Brazilian dominions, and joins the Amazon in latitude 3 deg. 24 min. 18 sec. south. Flowing in the same direction, but further eastward, are the Tapajos, the Xingu, and the Tocantines, all descending from the great central mountains; the two former flow out of the province of Matto Grosso; the latter from the region of Goyaz, in about latitude 19 deg. south. The Tapajos takes a northerly course for more than 600 miles between the Xingu and the Madera (its whole course being computed to be 900 miles in length), and falls into the Amazon in latitude 2 deg. 24 min. 50 sec. south; longitude 55 deg. west. The Xingu has a course of about 1200 miles, the navigation of which is frequently interrupted by cataracts. The Tocantines, the largest of the three, is joined by the Araguaya in latitude 6 deg.; and the united stream, after a course of about 300 miles, flows into the southern estuary of the Amazon in latitude 1 deg. 40 min. south, about twenty leagues west of the city of Para. Its whole length is upwards of 900 miles. The Rio Negro, which falls in from the north, is a large, clear, navigable river, communicating also with the Oronoco by a branch, the Cassiquiari. A little above its mouth is the fishing and boat-building town of Manoa, or Barro de Rio Negros.

We have, in the first book of this volume,* briefly described the discovery of this mighty river by the intrepid traveller Orellana, who, in a frail craft, descended the Amazon from the mountains of Peru to its mouth; and whose descriptions gave rise in Europe to the kingdom of El Dorado, and the unfortunate expedition of Raleigh.

Gonzalo Pizarro, the brother of the conqueror of Peru, marched, in 1541, from Quito, with an army of 300 soldiers, and 4000 Indians to serve as bearers of burdens, to seek the imagined kingdom of gold, believed, from some accounts of the persecuted aborigines, to exist east of the Andes.

The monarch of this fabulous kingdom, was said, in order to wear a more magnificent attire than any other king in the world, to be adorned in a daily coating of gold. His body was anointed every morning with a rare and fragrant gum, and gold dust was blown over him through a tube. Thus attired, the Spaniards named him "El Dorado" (the Gilded King). He was said to reside generally in the superb city of Manoa: in one street of which there were said to have been no less than 3000 silversmiths or silver-workers. The columns of his palace were affirmed to be porphyry and alabaster; his throne ivory, and its steps gold; the body of the palace was of white stone, ornamented with golden suns and silver moons; living lions, fastened by chains of gold, guarded its entrance.

To conquer such a monarch, city, and kingdom, might well allure Gonzalo and his army onward against all physical obstructions. Never was an expedition more fatal, and the discovery of the Amazon as a great navigable river, uninter-

* See pages 46 and 47.

rupted by falls or rapids, to the ocean, and the non-existence of the El Dorado, have been the only fortunate result. Considering it imprudent to return back to Peru over the Andes, from the wretched state to which his followers had been reduced by more than a thousand deaths from fatigue and famine, he reached the banks of the Napo, a tributary of the Amazon. From that point he resolved to proceed down the stream, and constructed such a vessel as the circumstances of his condition enabled him to build. He sent this craft, under charge of Orellana and fifty men, down the Napo, to stop at such a place as water deep enough was found to take all on board. Orellana descended rapidly, and instead of waiting for Pizarro, he continued the voyage downwards, fought with the natives, called them Amazons, as women were seen to command them; built a larger vessel, and reached the sea in five months. He then proceeded to Spain, was pardoned for deserting Pizarro, and received a charter to conquer the regions he had discovered. He succeeded in raising funds and enlisting adventurers for an expedition; and with a fleet he arrived on the coast in 1544, but amid the numerous channels at the mouth of the river, he failed to find the main branch. After a month or two spent without being able to ascend the river, Orellana, with many of his followers, sunk under disease, and died.

Southey considers that "as a discoverer, he surpassed any of his countrymen; and if, as a conqueror, he was unfortunate, it is now the happier for him, having never had the opportunity of committing those atrocities which blackened the characters of many of his contemporaries." Southey has even gone so far as to attempt to give the name of Orellana to the whole mighty river, and to reject that of Marañon, as having the same origin as Maranhão;* and denounces Amazon, from its fiction. In his map, and generally, in all his references, he denominates the great river Orellana. *O Amazonas* is, however, the general name among all those who traverse its waters, or who live upon its banks.

Para, which was the aboriginal name, signifies the Father of Waters, and still imparts its name to the province through which the Amazon flows down, as well as to its capital. The Para is also the name of the southern branch.

About seventy years after the expedition of Orellana the Portuguese began to settle in Para. In 1616, Francisco Caldeira, the first chief captain, founded the city of Para. In 1637, two Franciscan friars and six soldiers, who formed a mission to the aborigines, near the frontiers of Peru, descended the Amazon from Quito. Some of the missionaries grew weary and returned; others travelled onward, until the natives attacked and killed the officer in charge of the soldiers. Dismayed at the dangers and obstacles of a journey back to Quito, the survivors committed themselves to the floods, in a weak craft, as Orellana had done nearly a century before. They reached Para in safety, but were unable to give

* Both words have the same origin, being derived from the Portuguese *mare*, the sea, and *não*, not, *not the sea*, as the great river near its mouth appears to be.

any satisfactory account of the countries through which they had passed. The dread of cannibals seems to have deprived them of the powers of observation.

During the same year, the first expedition to ascend the Amazon was equipped under the command of Pedro Teixeira, who, with seventy soldiers, 1200 natives, as rowers and bowmen, and numerous females and slaves, in all about 2000, embarked in forty-five canoes. The strength of the current and the difficulty of finding their course amid the intricacies of numerous channels, opposed great difficulties and fatigue. Many of the Indians deserted, but unceasing perseverance and able conduct, enabled Teixeira, after a voyage of eight months, to ascend to the head waters of that navigation. Leaving most of his men with his canoes at this place, he journeyed overland to Quito, where he was received with distinguished honours. He was, on his return, accompanied by several friars to record an account of the voyage. This record was the first authentic information collected and published to the world. The party reached Para, then called Belem, in December, 1739. Afterwards voyages up and down the Amazon became more common.

In 1745, M. de La Condamine descended from Quito, and constructed a map of the river, based upon a series of astronomical observations. His memoir, read before the Royal Academy on his return, is at this day a very interesting and instructive work. In modern times, the most celebrated written voyages down the Amazon are those of Spix, Martius, Mawe, and Lieutenant Smyth.*

* Most, but not all, the voyages on the Amazon have been unattended with calamity, but the sufferings of Madame Godin have been of the greatest hardship. Her husband was an astronomer, associated with M. de la Condamine. He had taken his family with him to reside in Quito, but being ordered to Cayenne, was obliged to leave them behind. Circumstances transpired to prevent his return for a period of sixteen years, and when finally he made the attempt to ascend the Amazon, he was taken sick and could not proceed. All letters or messages that he attempted to send his wife, failed to reach her. A rumour reached her, that an expedition had been despatched to meet her at some of the missions on the upper Amazon. She immediately set out on this perilous journey, accompanied by her family, including three females, two children, her brother, and two or three men. They passed over the Andes and down the tributary streams of the Amazon. As they descended they found the missions in desolation, from the ravages of the small-pox. The village where they expected to find Indians to conduct them down the river, had but two inhabitants surviving: who could not aid them, without guides or canoe-men, and ignorant of the navigation, their misery was now beyond description; their canoe drifted down the current, and filled with water; they escaped with some provisions. They formed a raft, which was soon after broken upon a *snag*, a partly sunken tree. They escaped to the river-bank, and attempted to proceed on foot, without map or compass. They were soon bewildered in the forest. Wild fruits and succulent plants now became their only food; reduced by hunger, they soon fell victims to disease.

In a few days Madame Godin alone survived, amidst eight dead bodies; she attempted to bury them, but was unable. After two days spent in mourning over the dead, she determined to make a last effort; but she was nearly 3000 miles from the ocean, without food, and with her feet torn by walking amid the woods. Taking the shoes of one of the dead men she started upon her dreary way, during the day. At night she lay exhausted amid the most desolate wretchedness and horror. She was taken up on the ninth day at the river side, by a party of Indians in a canoe. They carried her to one of the missions, from which she was finally conveyed down the Amazon and restored to her husband, after nineteen years' separation. They returned to France together and lived in retirement; but she never fully recovered from the effects of her sufferings.

Mr. Kidder saw a fellow countryman at Para, who had visited Brazil for his health, and having to a great degree recovered, he was induced to make a voyage up the great river. The best vessel

The voyager on the waters of the Amazon, above Para, will scarcely see fifty houses in 100 leagues. There are but few settlements directly on the river. Most of the small settlements are on the tributary streams, and on the *iguarapés*, or bayous. The houses have all mud floors and thatched roofs.

It is astonishing how feeble have been the attempts to navigate the magnificent inland navigation of Brazil, and especially the waters of the Amazon and its tributaries. During the year 1827, a steam-boat company was formed at New York, with the express purpose of carrying on that navigation. It originated at the suggestion of the Brazilian government through its chargé d'affaires, Mr. Rebello, then in the United States, who stipulated for them great encouragement, and a grant of special privileges on the part of Dom Pedro I. A steamboat was fitted out and sent to Para, and other heavy expenses were incurred by the company; but from want of co-operation on the part of Brazil, the enterprize failed.

During the last three years, small government steamers have three or four times plied as far up the Amazon as the River Negro. Such voyages will, no doubt, be repeated, but we fear that little more will be effected in extending steam navigation on the Amazon for many years to come. The main stream of the Amazon is navigable for more than 2000 miles; the Tocantins, the Xingú, the Tapajos, the Madera, the Negro, the Purus, the Beni, and other rivers, are navigable for several thousand more. They altogether flow through regions with rich soil, and the most luxurious vegetation, but their waters are now only disturbed by alligators and reptiles, and now and then by the uncouth though large canoes. A different population than the Portuguese must inhabit its banks and open its navigation before it can be profitable. It is even probable that the intercourse between the Atlantic and Peru, in the productions of the latter, east of the Andes, may be the first established line of steam navigation.

Exclusive of the want of population on the banks of the Amazon, and other political and moral obstacles to opening the trade and navigation of those magnificent regions of the world, the Brazilian government has, with respect to the navigation of the rivers and harbours of the sea coast, limited the foreign commerce to a few ports. In the fertile province of Pernambuco, for example, the harbour of that name is the only port open to commerce. In fact, the fear and jealousy of the government of Rio de Janeiro of the power and prosperity of the northern provinces, has led to the most pernicious restrictions on trade and intercourse. Penedo, at the mouth of the Francisco, is well adapted for foreign trade, though the bar of the river's entrance has not more than sixteen feet depth of water over it. Yet this port is closed to foreign trade, from the jealousy of Rio Janeiro, in which he could procure a passage was a miserable trading smack. The inconveniences he suffered on board, together with the lack of fresh provisions and suitable accommodations when he went on shore, brought upon him a renewed and aggravated attack of disease. He was fortunate enough to obtain a passage down in a Brazilian war-schooner; but he only survived a few months.

that the produce of the province of Minas Geraes might escape to sea by the former instead of the latter port.

The RIO FRANCISCO, which has its rise in Minas Geraes, and after flowing northward for a considerable distance along the great longitudinal valley at the foot of the Brazilian Andes, dividing Bahia from Minas Geraes, turns at length to the east, and, separating Bahia and Alagos from Sergipe, enters the ocean in about the 11th parallel of south latitude, completing a course of upwards of 1000 miles. This is the largest river of Brazil, independent of the Amazon or the Plata.

From the mouth of the Rio das Velhas to the falls of Paulo Affonso, the distance of 1000 miles, the waters of the San Francisco are suitable for navigation; but from the few inhabitants on its banks, and the want of enterprize, it is but little used as the means of transport. The falls of Paulo Affonso are described, by those who have seen them, as a sublime cataract, down which the river thunders in magnificent grandeur. Above the falls the waters of this river sometimes overflow its banks for some leagues on either side, and the inhabitants are compelled to resort to the hills for safety. They are at such times forced to communicate with each other by boats or canoes. The low adjoining country is fertilised by these inundations.

Mr. Cowper, in order to make an expedition through the interior country up to the falls of San Affonso, on the San Francisco, and to report on the navigation of that river, left Pernambuco in January, 1846, for Maceio, in the little province of Alagoas; from Maceio he proceeded inland, and his report to the foreign office, from which we derive the following information respecting San Francisco, is both interesting and instructive. We shall in this chapter confine ourselves to that part of the report which is descriptive of this river. Mr. Cowper, on reaching its banks, by a tedious route over streams, barrens, forests, and mountains, observes, that the river after rising in 20 deg. south, in the province of Minas Geraes, flows direct north-east for 700 miles, during the last 300 of which, dividing the provinces of Bahia and Pernambuco, it turns abruptly to the east, finally to the south-east, and after running in that direction for 300 additional miles, falls into the Atlantic between the insignificant provinces of Sergipe and Alagoas, in 10 deg. 35 sec. south.

The Rio St. Francisco thus not only flows over upwards of 300 leagues of territory, but it passes through some of the richest provinces of the empire, containing more than half its whole population.

The government of Rio de Janeiro, to cut off the provinces of Bahia and Pernambuco from the mouth of the San Francisco, created two new provinces: taking one from each of the above, merely from a spirit of jealousy; and although Penedo, near the mouth of the San Francisco, a prosperous town, seven leagues only from the sea, offers every facility for navigation, nothing has as yet

induced the government to make it a port for foreign trade. The cotton, sugar, and timber produced in its neighbourhood, are now shipped in large canoes, and are, by this wretched tortuous manner, carried to Maceio, Pernambuco, and Bahia.

No plausible objection can even be imagined to making Penedo a port, as at present the navigation of the Francisco is physically barred for fifty leagues, by the falls of Paulo Affonso, and therefore could not interfere with the commerce carried on between Minas and Rio de Janeiro. The throwing open of the lower portion of the River San Francisco, would at the same time be highly advantageous to Brazil, and to every nation with which she has commercial intercourse; especially if the navigation of the whole river were opened by a canal to surmount the falls.

The falls and their obstructive effects upon navigation may be said to extend for twenty-two leagues. The Barra de Moxotô, which Mr. Cowper reached on the 5th of February, 1846, he considers the centre of the cataracts or rapids above the great cascade, that is to say, three leagues above it, and three below the first falls of Itaparica. The river at Moxotô, is about a mile wide, and was on the 5th of February, about half-full as it is termed, which may be explained by stating that from Christmas to Easter, the rains of the interior flood the river, at which period it is full, and it gradually subsides until Michaelmas, when it is termed empty. From the Falls of the Itaparica to those of Paulo Affonso, the river is one roaring, hissing, boiling, foaming rapid, interspersed with rocky yellow limestone islands, the largest of which, the Ilha Tapuya, is covered with verdure; upon the banks there exists, at long intervals, a miserable house; the soil is dry and arid, producing scarcely any vegetation; it is the worst part of the *Catinga*, and near the great falls bears the fearful name of "*Os Morlds de Curocira*," few Europeans, indeed very few natives had visited this spot before Mr. Cowper, and it was with feelings nearly approaching to awe that he descended the banks of the river towards the falls. "At every step the rapids increased in force, noise, and fury, and shortly before disappearing from view amidst the spray, they literally appeared to shriek in the confusion of sounds at their inevitable fate; a hundred yards above the falls it is necessary to pass a small arm of the river, but so rapid is the current of the main body, that the water articulates like an artery; at one moment it is quite dry, at another full, for this reason it is called the "*Vai e Vem*," or "Go and come." From the Cascade of Itaparica to those of Paulo Affonso, the river runs nearly north and south, immediately below it turns at right angles to the east, it is consequently viewed from exactly opposite: the effect is stupendous. You stand upon a rock inaccessible from the water, it being quite perpendicular, it is almost upon a level with the top of the falls, which are about a quarter of a mile distant, these are composed of five distinct cascades, four of which present themselves at once to

the view, and cannot be less than 900 feet high, and half a mile broad, they are embosomed in an amphitheatre of rock, composed of the same yellow limestone, and have a huge solitary island of the same formation immediately before them, and in the centre of the amphitheatre, within the interstices of the rocks, vegetation springs forth, and upon their summits small trees, brushwood, and *cactaceæ*; from the continued spray, the tints of all these are most vivid, the rocks of the brightest sepia, and the vegetation of the richest green. Upon the Pernambuco side the first fall is an escada, or ladder fall, and passes to the left of the island, in a direct line from its summit, one vast sheet of foam, to the main land, from whence it is viewed, dashing itself with inexpressible fury against its base; the second and third falls are behind the island, and are the main falls, they dash against it with such force, that a solid body of water again rises in the air, and falling once more into the basin, throws up a spray which is seen for leagues, it then rushes round the right side of the island, is joined in its descent by the waters of the fourth fall, and they precipitate themselves to its base, there they unite with those of the first fall, dash against the mainland opposite, and then, apparently exhausted with their efforts, run rapidly, but smoothly, betwixt perpendicular rocks, not 100 yards apart, to the east; a quarter of a mile lower down, the fifth fall joins the rapids, which continue without intermission for sixteen leagues to Peraubas, on the Pernambuco side, and Canindi on the Bahia; at the angle formed by the river at the falls, there are two huge caves, the descent is effected with considerable risk by the bed of a small rivulet which runs into the lower basin of the falls, with bare feet and a steady eye, it is necessary to pass from rock to rock, one false step would be certain destruction. Upon reaching the caves, they consist of two immense hollows, 200 feet deep and 100 high; in the centre is a rock like a rostrum; the caves are infested by immense bats, who have deposited guano sufficient to load several vessels; at the mouth of the caves are quantities of timber, bones, &c., of trees and animals which have descended the falls." M. de Goussencourt, who accompanied Mr. Cowper, observed upon the spot, "that if all the falls of Italy and Germany which he had seen, were united, they would not equal those of Paulo Affonso."

For twenty-two leagues Mr. Cowper considers the river one vast cataract, at present insurmountable for the navigation to the upper river from the sea; but above San Affonso it is deep, broad, and said to be navigable for 200 leagues. Of various plans which have been proposed, Mr. Cowper considers that there are two which appear to be feasible, namely, a canal or a railroad; the former might be brought from Itaparica on the Bahia side, and running along parallel with the river through a marsh as far as the Great Cascade, or very nearly, might find its way along the base of the Muribeca Mountains to Canindi; the Bahia side he considered the most desirable, as owing to the angle formed in the course of the river at Paulo Affonso, it would be the shorter, forming the base

of a triangle. He had neither time nor means of examining the ground. He has no doubt that a canal of twenty or thirty leagues in length would open the navigation of the Francisco. The other plan would be to construct a railway from the Pernambuco side, above Itaparica, to the city of Pernambuco, but he apprehends this would be vastly more expensive than the former; and he also apprehends that no proposal, having for its object the opening of the navigation of the Rio San Francisco, particularly above the falls, would be favourably received at Rio de Janeiro. On leaving the falls, he re-crossed the "Catinga," passing the Fazendas de Gado of Cruzes, Salgado, Lagumes, Xinga, Falhado, and Olha d'Agoa, and the streamlet of Luca, and once more reached the San Francisco, on the 8th of February, at Peranhas, sixteen leagues below the falls; it is a place of some little commerce, being the spot to which *farinha*, and other necessities of life, are brought from the coast to the *sertao*: it contains about 300 inhabitants, and was at the time of his visit filled with refugees.

Peranhas, is so called from the quantities of fish of that name abounding in this part of the river. They render bathing extremely dangerous, are very small, of a red colour, and are so voracious and numerous, that they have been known to kill an ox before he could pass the stream. Another fish, called the *cherubim*, is peculiar to the Francisco, it grows to an enormous size, resembling a huge trout, excepting that the spots are black, is extremely rich and delicious eating, and would yield vast quantities of oil.

In his descent from Peranhas to Penedo, he passed several small towns and settlements, which exhibit a larger than ordinary population on its banks than in many other parts of Brazil.*

The distance from Peranhas to Penedo is about thirty-five leagues. He embarked with his horses at the former place in a huge canoe, and floated down with the rapid current to Penedo in two days and nights; on no one occasion did the boatmen use their oars. The scenery of the river is extremely grand, and resembles that of the Italian lakes. During the dry season large rocks appear above the water, leaving, however, a clear and deep channel for the navigation; it is everywhere interspersed with islands.

Penedo is about seven leagues from the sea, and is a flourishing place, containing 5000 inhabitants. *Villa Nova*, its rival, on the opposite bank, is greatly

* The following are the names of these places:—

Upon the Bahia and Sergipe side:—Cunendê, Ferada, Coleti, Angica, Caxoeira, Tacari, Caxoeira, Carolina Nova, Carolina Vilha, Budeigo, Ilha de Ferra, Ospatos, Tacco Grande, Caxoeiro, Lagôa das Pedras, San Pedro, Aratica, Francisca e Julia, Os Porteiros, Ilha d'Ouro, Ilhadas Entaes, Terpetê, Patuba, Lagoa Azeda, Coral das Pedras, Serra da Pabunsa, Boraco de, Maria Ferreira, Villa Nova.

Upon the Pernambuco and Abagoas side:—Piranhas, Barra de Cabaca, Bonita, Ilha de Ferra, Prairas, Pao Ferro, Pas d'Assucar, Espinas, Limoeira, Lagoa Furda, Barra de Panêma, Tacobim, Mundo Novo, Sacco, Queimado, Traipa, Serra de Pas d'Assucar, Serra de Pemea, San Braz, San Colegio, Ilha Munbu, Ilha Maunha, Alagoas, Bubenarê, Ilha de Corcia, Barra de Imbusica, Penedo.—See a catalogue and description of these woods hereafter in the Statistics of Brazil.

its inferior. The bar of the San Francisco has fifteen feet of water over it but the channel changes its place, owing to shifting sands.

Mr. Cowper procured specimens, at Penedo, of all the Brazilian woods which he considered adapted to ship-building, &c.

CHAPTER III.

CLIMATE, SOIL, AND PRODUCTIONS.

Climate.—Although the greater part of Brazil lies within the tropics, a considerable portion of territory is in the southern temperate zone, and the climate varies greatly in its different regions. Extensive table-lands are elevated from 2000 to 2500 feet above the sea. The plains on the Rio Amazon, and those east of the mouth of that river, are characterised by excessive heat, and by rain falling during every month of the year. This climate appears to prevail as far south as 10 deg. latitude, with the exception of the country east of about 41 deg. west longitude, which suffers rather from drought. The second region comprehends the countries south of 10 deg. latitude, to the Serra dos Vertentes. The low country along the sea resembles in its climate that of tropical countries which are little elevated above the ocean, and with mountainous backgrounds. The heat is often oppressive in summer, and the rains are abundant. In other parts of the year little or no rain falls. The terraces, or elevated *steppes*, by which the country rises to the highest table-lands, partake in some degree of the peculiarities of this climate, where the ascent is rather steep, as between 18 deg. and 24 deg. south latitude; but where the country rises slowly, and the terraces are wide, as between 10 deg. and 18 deg. south latitude, rain is by no means abundant, and years often pass without a drop falling. On the table-lands the mean annual temperature seems to differ from that of the coast by eight or ten degrees. The rains are more regular than on the declivities, but they are far from being abundant, and the vegetation of this region is much less vigorous than along the loose soils of the sea coast. According to meteorological observations, it would seem that the rains diminish on proceeding westward, and that some of the western *Campos* are little better than arid deserts. In the most elevated table-lands night frosts are experienced, when the sun is near the northern tropic. The countries south of the Serra dos Vertentes are chiefly situated in the temperate zone, at least those east of 55 deg. west longitude, which are drained by the Paranà. The rains fall most abundantly in summer, but in other seasons rains are also frequent. The heat is moderate, and the vegetation, though vigorous, less so than towards the coast further north. The countries which are drained by the Paraguay, and lie west of 54 deg., have a much hotter

climate, and abundant tropical rains, but there is a long dry season in which no rain falls. In these parts frost does not occur. During the winter months south of 30 deg. latitude the table-land of Curitiba and the more elevated tracts towards the boundary of Uruguay seem to have a regular winter season of a few weeks, with occasional frost.*

In the northern parts, situated in the centre of the torrid zone, the air of the lower tracts is sultry and oppressive; but vegetation is vigorously nourished by the night dews. In these regions there is little distinction of seasons: the flowers are in perpetual bloom, the foliage is evergreen; and with the grandeur of the forests, and the delicious coolness of the nights, impart to the country and climate a perpetual spring. Near the coast, the trade-wind, which blows over the whole breadth of the Atlantic, imparts refreshing coolness to the atmosphere of these naturally sultry regions. The northern provinces, however, occasionally suffer from the want of rain. In ascending towards the sources of the great rivers, the temperature is modified by the elevation of the country, and as the distance increases from the equator. On the *Campos Parexis* and other similar *plateaux*, with arid soil, the solar heat is intolerable; but within many of the elevated districts of the interior, fertile valleys are found with a temperate and salubrious climate, where the vegetables and fruits of Europe will ripen. Such is the climate of parts of Minas Geraes and San Paulo. Towards the southern extremity of Brazil, and in the higher mountainous districts, the air is colder, and the soil yields European grain in great perfection. The west wind passing over vast marshy forests, is frequently found unhealthy in the interior. The northern provinces are at times subject to heavy rains, variable winds, torna-

* Mr. Kidder says, "The climate of Brazil is remarkably mild and regular. At Rio de Janeiro there cannot be said to be any regular rainy season. It would be difficult to fix on the months in which most rain may be expected. During the rains there is generally but little wind, and the temperature changes but slightly throughout the day. In dry weather the mornings and evenings are always cool, and the heat of the day is almost invariably mitigated by a strong sea-breeze.

"The south-east trade winds sweep the whole coast. From March to September, during the southerly monsoon, the prevailing winds are from east-by-north to east-south-east. During the northerly monsoon, from September to March, the winds are from north-by-east to north-east-by-east."

METEOROLOGICAL Table kept at Rio de Janeiro, 1838-1839.

does, and thunder-storms ; while the southern regions have a more settled, temperate, and salubrious climate.

Soil.—An empire of such great extent as Brazil comprises every variety of soil, from the sandy lands of the sea coast to the ruggedness of the mountains ;—from the alluvions of the great and lesser rivers, to the undulated and wooded midlands, up to the pastures and bare plains of the table lands, and back to the arid *Campos*.

Fertility may be considered the general character of the soil ; but with some broad exceptions, as the arid plains of the interior, and the sandy and rocky districts.

Products and Agriculture.—Nearly all the trees and natural products which were found in the West Indies abound in the north parts of Brazil. In the forests and plains there are also many other natural products. In the southern or temperate provinces, the grains, vegetables, and fruits of Europe succeed, and wheat, barley, rice, maize, and tobacco are also grown. Within the tropics the chief products of agriculture are mandioca, rice, yams, bannanas, plantains, beans,

and sweet potatoes, with coffee, sugar, cotton, and cacao; the four last-mentioned articles are chiefly cultivated for exportation. The forests supply excellent timber for ship-building and for the construction of houses; several kinds of wood for cabinet work, and others for dying; among the dye-woods, Brazil-wood and Campeche-wood are important articles of trade. Other products are vanilla, sarsaparilla, ipecacuhana, gingers, peppers, canella do clavo (from the *Persea caryophyllata*, Mart.) anatto, caoutchouc, copal, and copaivi balsam, pitch, Brazil nuts, tamarinds, tonca, and pechurim beans. Cinchona bark also exists, and many others abound.* The yerba-maté is found in the southern provinces and is exported, chiefly to Peru. Pine-apples, oranges, figs, and other fruits, ripen in perfection.

It is estimated that not more than one acre in 150 of the whole cultivable area of Brazil is under any kind of culture. Probably not one acre in 200.

Forests.—The interior consists, in many parts, of one continuous forest: at a little distance from the coast, the country, in some parts, is covered with numerous varieties of the palm-tree, among which is a remarkable species with long, serrated, lancet-formed leaves, composed of innumerable fibres, which rival silk both in fineness and in strength. The sandy soils of the coast are turned to account by plantations of the cocoa-tree, which grows here thicker and taller than in the East Indies. The Brazilians say, that this tree affords them both food and shelter. Of the trunk and the leaves their huts are built; of its fibrous roots baskets are made, and cordage of the outward husk; cups are made of the shell; its fruit supplies meat and drink; and an excellent oil is obtained by skimming the juice which may be pressed from the pulp. The cocoa kernel is in general use in cookery; and it forms an important article of internal trade. The carrapato, or castor-tree, is also an indigenous production, much cultivated for the sake of the oil extracted from the seed, which is in general use for lamps and other purposes: it also grows spontaneously. The ibiripitanga, or Brazil-wood tree, called in Pernambuco, the *pao da rainha* (queen's wood), on account of its being a government monopoly, is now rarely to be seen within many leagues of the coast, owing to the improvident manner in which it has been cut down by the government agents, without any regard being paid to the size of the tree or to its cultivation. It is not a lofty tree: at a short distance from the ground, innumerable branches grow forth and extend in every direction in a straggling, irregular, manner. The leaves are small and not luxuriant; the wood is very hard and heavy, takes a high polish, and sinks in water: the only valuable portion of it is the heart, as the outward coat of wood has not any peculiarity.† Besides these, we

* See lists of trees and barks hereafter, under the head of Statistics of Brazil.

† The name of this wood is derived from *brasas* (or *branzas*), a glowing fire or coal. Its botanical name is *Cæsalpinia Brasiletto*: it belongs to the genus *Lomentaceæ*, in Linnæus's nat. order, and is a leguminous plant, of the class *Decandria Monogynia*. The leaves are pinnated: the flowers are white, papilionaceous, growing in a pyramidal spike. One species has flowers variegated with red. The branches are slender and full of small prickles. There are nine species.

may enumerate among the vegetable productions of Brazil, the cedar, the wild cinnamon-tree, and the jacaranda, or rosewood, valuable for cabinet work; the tatajuba, or fustic, yielding a yellow dye; the Brazilian myrtle, a beautiful shrub; the siccupira, resembling the teak of India; the peroba, oraubu, and loiero, resembling a species of oak and larch; logwood, mahogany, and a variety of forest-trees, invaluable for the purposes of ship-building.

The original forests are called in Brazil, *mato virgem*, virgin forests. Dr. Von Spix gives us the most graphic account that we have read of these forest regions. He says,

“Almost every one of these sovereigns of the forest is distinguished, in the total effect of the picture, from its neighbour. While the silk-cotton-tree (*bombax pentandrum*), partly armed with strong thorns, begins at a considerable height from the ground to spread out its thick arms, and its digitated leaves are grouped in light and airy masses, the luxuriant lecythis and the Brazilian anda shoot out at a less height many branches profusely covered with leaves, which unite to form a verdant arcade. The jacaranda (rose-wood tree) attracts the eye by the lightness of its double-feathered leaves: the large gold-coloured flowers of this tree and the ipe (*bignonia chrysantha*), dazzle by their splendour, contrasted with the dark green of the foliage. The spondias (*s. myrobalanus*), arches its pinnated leaves into light oblong forms. A very peculiar and most striking effect in the picture is produced by the trumpet-tree (*cecropia peltata*), among the other lofty forms of the forest: the smooth ash-grey stems rise slightly bending to a considerable height, and spread out at the top into verticillate branches, which have at the extremities large tufts of deeply lobated white leaves. The flowering casalpinia; the airy laurel; the lofty geoffrœa; the soap-trees with their shining leaves;* the slender Barbadoes cedar; the ormosia with its pinnated leaves; the tapia or garlic pear-tree, so called from the strong smell of its bark; the maina; and a thousand not yet described trees, are mingled confusedly together, forming groups agreeably contrasted by the diversity of their forms and tints. Here and there, the dark crown of a Chilian fir (*araucaria imbricata*), among the lighter green, appears like a stranger amid the natives of the tropics; while the towering stems of the palms with their waving crowns, are an incomparable ornament of the forests,† the beauty and majesty of which no language can describe.

The colour produced from this wood is greatly improved by a solution of tin in aqua regia, which, when mixed with the aqueous tincture, affords a beautiful precipitate of a purplish crimson, substituted sometimes for lake. It is used for dyeing silk what is called *false crimson*, to distinguish it from that produced by cochineal. It is indigenous to both the East and the West Indies, and is the same as Sapan wood.

* *Sapindus saponaria*. The fruit is brought to the city in large quantities; the poorer class use them instead of soap. “In many years, one of these trees, which are generally about the size of our nut-trees, produces several bushes of this fruit, which contains a great quantity of saponaceous matter.”—*V. Spix*, p. 280.

† The cocoa-palm is frequently seen above thirty feet high. Mr. Mawe measured a fallen tree (he does not mention the species), which was full seventy-six inches in diameter at the thick end, and above twenty-five yards in length. Prince Maximilian says—“The colossal trees are so lofty, that our fowling-pieces could not carry to the top of them, so that we often fired in vain at the finest birds.”—*Travels*, p. 43.

Mr. Luccock describes a very singular tree, “one of those vegetable productions,” he says, “whose size astonishes the English traveller. It is here called a *gamelleiro* (from *gamella*, a great wooden bowl or trough) because from its trunk are turned those large bowls which are used as baths. The smallest part of its stem was eight feet above the ground, and there the circumference measured fourteen feet. Immediately below this line the roots begin to project in the manner of buttresses, and produce that kind of timber which is particularly esteemed in forming the knees of large ships. These terminate in the roots, which run along the surface of the ground, and appear above it in a circle of seventy-six paces, each of which was intended to measure a yard. One of these roots, at the distance of sixteen feet from the body of the tree, rose wholly above the soil: its girth measured four feet. The branches, which begin to expand immediately above the line where the trunk was measured, extend on each side thirty-five feet, so that the whole head forms a well-clothed hemisphere of more than 200 feet in circumference.”—*Notes, &c.*, p. 393.

"If the eye turns from the proud forms of those ancient denizens of the forest, to the more humble and lower which clothe the ground with a rich verdure, it is delighted with the splendour and gay variety of the flowers. The purple blossoms of the rhexia; profuse clusters of the melastoma, myrtles, and the eugenia; the delicate foliage of many rubiaceæ and ardisiæ, their pretty flowers blended with the singularly formed leaves of the theophrasta; the conchorcarpus; the reed-like dwarf palms; the brilliant spadix of the costus; the ragged hedges of the maranta, from which a squamous fern rises; the magnificent stiftia, thorny solana, large flowering gardenias and coutereas, enlivened with garlands of miconia and bignonia; the far-spreading shoots of the mellifluous paulinias, dalechampias, and the baubinea with its strangely lobated leaves; strings of the leafless milky *lianes* (bind-weed), which descend from the highest summits of the trees, or closely twine round the strongest trunks, and gradually kill them; lastly, those parasitical plants by which old trees are invested with the garment of youth, the grotesque species of the pothos and the arum, the superb flowers of the orchideæ, the bromelias which catch the rain-water, the tillandsia, hanging down like *lichen pulmonarius*, and a multiplicity of strangely formed ferns: all these admirable productions combine to form a scene which alternately fills the European naturalist with delight and astonishment.

"But the animal kingdom which peoples those ancient forests, is not less distinguished than the vegetable world. The naturalist who is here for the first time, does not know whether he shall most admire the forms, hues, or voices of the animals. Except at noon, when all living creatures in the torrid zone seek shade and repose, and when a solemn silence is diffused over the scene illumined by the dazzling beams of the sun, every hour of the day calls into action a distinct race of animals. The morning is ushered in by the howling of the monkeys, the high and deep notes of the tree-frogs and toads, the monotonous chirp of the grasshoppers and locusts. When the rising sun has dispelled the mists which preceded it, all creatures rejoice in the return of day. The wasps leave their long nests which hang down from the branches; the ants issue from their dwellings, curiously built of clay, with which they cover the trees, and commence their journey on the paths they have made for themselves, as is done also by the termites, which cast up the earth high and far around.* The gayest butterflies, rivalling in splendour the colours of the rainbow, especially numerous hesperiæ, flutter from flower to flower, or seek their food on the rocks, or, collected in separate companies, on the cool streams.† The blue shining Menelaus, Nestor, Adonis, Laertas, the bluish-white Idea, and the large Eurolychus with its ocellated wings, hover like birds between the green bushes in the moist valleys. The Feronia, with rustling wings, flies rapidly from tree to tree, while the owl-moth (*noctua strix*), the largest of the moth kind, sits immoveably on the trunk, with outspread wings awaiting the approach of evening. Myriads of the most brilliant beetles buzz in the air, and sparkle like jewels on the fresh green of the leaves, or on the odoriferous flowers. Meantime, agile lizards, remarkable for their form, size, and brilliant colours,

* "It is scarcely possible," says Mr. Luccock, "to conceive of a greater plague than that which is produced by the ants. In the forests below, they form their nests beneath the surface of the ground, or pile cones of sand, eight or ten feet high, generally round the root or stem of a tree. But, on these heights, their nests stand by the roadside, in the form of rough pillars made of earth and leaves, more than eight feet high and three in diameter. They resemble bee-hives in shape; and at first I thought them the production and abode of bees; for some of them have been opened with a *machado* (axe), for the purpose, as I was told, of procuring honey. Examining them, I found the inside hollow and very black; the walls were from six inches to a foot thick, and full of innumerable passages communicating with each other, but with the external air only at the base, which is a little contracted and thus sheltered from rain. The upper part frequently appears patched, as though an addition had been made to the cells, or a breach repaired. Whether the bees drive out the ants, or only take possession of a deserted hive, I know not; but I found they were of a small brown species, such as I had never noticed below. Within the hollow they deposit their round balls of wax and honey, and are deprived of it by travellers."—*Notes*, &c., pp. 404-5.

Henderson enumerates, among the various species of the Brazilian bee, "the cupimeira, so denominated because it occupies the houses deserted by the cupim (ant)."

† A collection of 1600 different species of butterflies was made in Brazil some years ago.

and dark-coloured, poisonous, or harmless serpents, which exceed in splendour the enamel of the flowers, glide out of the leaves, the hollows of the trees, and holes in the ground, and, creeping up the stems, bask in the sun, and lie in wait for insects and birds. From this moment all is life and activity. Squirrels and troops of gregarious monkeys issue inquisitively from the interior of the woods to the plantations, and leap, whistling and chattering, from tree to tree. Gallinaceous jacues,* hoccoes,† and pigeons, leave the branches, and wander about on the moist ground in the woods. Other birds of the most singular forms, and of the most superb plumage, flutter singly or in companies through the fragrant bushes. The green, blue, or red parrots, assembled on the tops of the trees, or flying towards the plantations and islands, fill the air with their screams. The toucan, sitting on the extreme branches, rattles with his large hollow bill, and in loud plaintive tones calls for rain. The busy orioles creep out of their long, pendent, bag-shaped nests to visit the orange-trees, and their sentinels announce, with a loud screaming cry, the approach of man. The fly-catchers, sitting aloof, watching for insects, dart from the trees and shrubs, and with rapid flight catch the hovering Menelaus, or the shining flies, as they buzz by. Meantime, the amorous thrush‡ (*turdus Orpheus*), concealed in the thicket, pours forth her joy in a strain of beautiful melody; the chattering manakins, calling from the close bushes, sometimes here, sometimes there, in the full tones of the nightingale, amuse themselves in misleading the hunters; and the woodpecker makes the distant forests resound while he pecks the bark from the trees. Above all these strange voices, the metallic tones of the uraponga (or guiraponga) sound from the tops of the highest trees, resembling the strokes of the hammer on the anvil, which appearing nearer or more remote according to the position of the songster, fill the wanderer with astonishment. While thus every living creature by its actions and voice greets the splendour of the day, the delicate humming-birds, rivalling in beauty and lustre diamonds, emeralds, and sapphires, hover round the brightest flowers.§

* The jacu is the size of a large capon, black, with the figure of a turkey-hen. The jacu-tinga and jacu-penba are varieties of the same genus.

† Probably the *soco* is meant, described by Henderson as about the size of a large capon, without a tail; there are several species, a white, an ash-coloured, and other varieties.

‡ Alluding, apparently, to this bird, the author says in another place: "We first observed in these woods the notes of a greyish-brown bird, probably a thrush, which frequents the bushes and grounds in damp, low woods, and sings with numerous repetitions through the musical scale from H 1 to A 2 (of the German scale) so regularly, that not a single note is wanting. It commonly sings each note four or five times over, and then proceeds imperceptibly to the following quarter-tone. It is usual to deny to the songsters of the American forests all melody and expression, and to allow them no pre-eminence but splendour of plumage. But if, in general, the pretty natives of the torrid zone are more distinguished by the beauty of their colours, than by fulness and power of note, and seem inferior to our nightingale in clearness and melodiousness of tone, yet, this little bird, among others, is a proof that they are, at least, not destitute of the principles of melody."—Vol. i. p. 287.

Mr. Henderson, in his list of Brazilian birds, has the *sabia*, "a kind of thrush, and the greatest singer in the Brazil: its song does not differ from the blackbird." Prince Maximilian notices the same bird. "The red-bellied thrush, here called *sabiah*, sat pouring forth its melancholy though pleasing song on the tops of the bushes." (*Travels*, p. 53). Mr. Luccock has a remarkable anecdote of this bird. "The incident, an affecting one, led him, he says, to doubt whether the song of birds is always an indication of pleasurable feeling. He had shot a "*sabiar*," whose note he describes as very full and melodious. "Though badly wounded, it struck up a song, and continued it to almost its latest moments."—*Notes*, &c., p. 307.

§ "The *Colibri*, or humming-bird, known in Brazil only by the name of *Beija Flor* (kiss the flower), is the smallest bird existing. Their varieties have been stated at six or seven, but there are a great many more. Padre Cazal has seen ten different kinds. A European would never have supposed that a bird so small as the end of one's finger, could exist, furnished as it is with a bill, feathers, wings, and intestines, similar to the larger kind; and he would be naturally disposed to consider it as but a creature of imagination, until he visited its native country, and daily beheld it fluttering like a butterfly at every flower, and humming a gentle chirrup. It has long wings compared with the size of the body. The largest, of the size of a very small wren, are of an indigo colour, with a white spot upon the back. The second species differs from the first only in being smaller, and not having a spot, both have a long tail much forked. The third kind and size are gray, and make their nests in inhabited houses, in the form of a little pocket, suspended from the

"When the sun goes down, most of the animals retire to rest: only the slender deer, the shy peccari, the timid agouti, and the tapir, still graze around; the nasua and the opossum, and the cunning animals of the feline race, steal through the obscurity of the wood, watching for prey; till at last, the howling monkeys, the sloth with a cry as of one in distress, the croaking frogs, and the chirping grasshoppers with their monotonous note, conclude the day. The cries of the macuc, the capueira, and the goat-sucker (*caprimulgus*), and the bass tones of the bull-frogs, announce the approach of night. Millions of luminous beetles now begin to fly about like *ignes fatui*, and the blood-sucking bats hover like phantoms in the profound darkness of the night."*

In Brazil, man has much less to fear from wild beasts than from reptiles, the species of which are almost innumerable, and the greater part are said to be venomous. This, together with the plague of mosquitoes and other winged enemies, must be admitted to form some drawback on the beauty and luxurious temperature of the climate.† As the ground, however, becomes cleared, and the marshy

point of a straw. The fourth variety are entirely green. The fifth are the same colour and size, with a white spot upon the breast. The sixth differs from the preceding only in having a very short tail. The seventh is of the same colour and size, with the tail yellow. The eighth is the colour of the nightingale, the breast finely speckled with white. The ninth is of a brilliant green, with the wings and tail dark, the beak short, slender, and yellow: all the others have it long, pointed, very delicate and straight, with the exception of the gray ones and those of the nightingale colour, who have it a little curved. The tenth kind is dark, or almost black, with a short tail of the colour of fire, the bill black and of medium length: when turned towards the spectator, the throat and breast exhibit at one instant various colours, according to the movements of the bird; at one time that of Aurora when most bright, or like gold melted in the crucible, followed on a sudden, sometimes by a suffusion of green, at other times by blue, or by white, without ever losing its inimitable brilliancy. The head, which is black, appears ornamented with a little crest of the same colour, when the bird has its side towards the observer: when it presents the front it appears studded with sparkling rubies, or all of a brilliant scarlet, which insensibly changes to refulgent yellow. They generally have the tongue very long, the legs exceedingly short, and the eyes black. Their principal aliment is the juice of honey of flowers, which they extract, not as the bee, but in the same manner as the butterfly. Some of them have the tongue cleft."—*Henderson's History of Brazil. Appendix, pp. 509, 510.*

* Von Spix, vol. i. pp. 239—49.

† "The finest orange-groves frequently fall a prey to the brown ants, which gnaw off the bark, or to the mole crickets, which devour the roots. The young mandioca and sugar plantations are often invaded, stripped of their leaves, and laid waste by similar enemies in incredible numbers or deprived of their roots by the wasps which live under ground. But even when the crop has happily reached maturity, the owner must share it with many foreign guests. Swarms of monkeys, flocks of parrots and other birds, attack the plantations; the paca, agouti, and other kinds of wild swine, eat up the leaves, stalks, and fruits; and myriads of tenthedroes injure the crop. The planter himself, particularly if he has just arrived from Europe, and is unaccustomed to this climate, has many hard trials to undergo from tormenting animals. If he does not keep his dwelling closed, particularly in the morning, evening, and at night, there are swarms of large and small mosquitoes which torment him with their stings, even through the thickest clothes; and only gauze or silk can secure him against these enemies. The earth-flies (*pulex penetrans*) which are concealed in numbers in the sand, penetrate under the nails of the hands and feet, and by producing a blister filled with little eggs, cause the most painful sensations, which, if the sympathetic swelling of the inguinal glands is neglected, are often followed by mortification. The blister, as soon as it gives pain, must be carefully removed, and snuff rubbed into the wound. Besides these, the inhabitant has often other enemies in his house. The white-bellied ant (*cupim, termes fatale*), a great number of blattæ, and other vermin, continually oblige him, by their destructive fury, to make new arrangements. The former cause the most terrible devastation wherever they pass in their course, for, metals excepted, they gnaw through every thing; and in a few days, the beams of the house are rotten; the linen, books, and all the household furniture are destroyed. The blatta commits great destruction among the vegetables in particular, and, in the night, even attacks the tips of the fingers. Without are numberless enemies. Not to mention the savage ounce, the poisonous serpents, lizards, scorpions, centipedes, and spiders, which, fortunately, are not frequently met with, and wound a person only when provoked; the mite (*acarus*), called *carabatos*, is one of the most formidable plagues. These little animals, from the size of a poppy-seed to that of a linseed, live in societies, and crowded by hundreds in the grass and on dry leaves,

lands are drained, most of the reptiles and insects are gradually expelled or diminished. The primeval forests are giving way, but not by any means so rapidly and effectually as in Anglo-America, before the axe and the flames; and their various tenants retreat to regions more remote from the invasion of man.

The luxuriant power of vegetation in the fertile soil of Brazil produces the greatest variety of plants. When the trunk of a tree has a decayed hole or a crevice in it, arum, caladium, dracontium, and other productions of that kind, throw out large tufts of juicy, heart-shaped or arrow-shaped, dark-green leaves, which add to and embellish the forests.

In some places, where the forests have been burnt down to clear the ground for cultivation, the immense scorched trunks appear like the ruins of colonnades, still in parts joined together by the withered stalks of their parasites. Sometimes, the climbing plants so interlace and surround the larger trees, that it is impossible for the eye to penetrate the "verdant wall." Many of them are decked with the most brilliant flowers; one kind of bromelia, with a deep coral-red flower, has its leaves tipped with violet: the heliconia, a kind of banana, has a dark-red calyx and white flowers. The bauhinia with its strong woody branches growing in alternate arcs of circles, and the concavity of each hollowed, with a short blunt thorn on the convex side, climbs to the tops of the highest trees. Many of these creeping plants shoot downwards their long branches, which, taking root, impede the progress of the traveller. "In general," says the Prince Maximilian, "vegetation is so luxuriant in these climates, that every old tree we saw, presented a botanical garden of plants, often difficult to come at, and certainly for the most part unknown." "Even the rocks," remarks the same traveller, "are here covered with lichens and cryptogamous plants of a thousand various kinds; particularly the finest ferns, which in part hang like feathered ribbons in the most picturesque manner from the trees. A deep red horizontal fungus adorns the dry trunks; while a fine carmine-coloured lichen (on the properties of which, as a dyeing matter, some experiments have been made in England), covers the bark of the stronger trees with its round knobs."*

Mr. Luccock describes the various tints of a Brazilian forest as extending

As soon as the traveller touches such a plant, they very quickly penetrate through his clothes to the skin, where they eat in, particularly in the more tender parts, and cause an intolerable itching, which is increased by the inevitable rubbing, and in the end produces an inflamed blister."—*Von Spix's Travels*, vol. i. pp. 258—60.

"With such a fulness of life, and such a vigorous striving at development, even so rich and fertile a soil is incapable of furnishing the necessary nourishment in sufficient abundance. Hence, the gigantic trees are in a constant struggle for their own preservation, and impede each other's growth still more than the trees in our forests. Even stems which have grown to a considerable height, requiring a large supply of nutriment, feel the influence of their more powerful neighbours, are suddenly arrested in their growth by being deprived of the requisite juices, and thus become in a short time subject to a rapid dissolution. We thus see the noblest trees after suffering an atrophy of some months' duration, eaten away by ants and other insects, seized with decay from the root to the summit, till, to the terror of the solitary inhabitants of the forest, they fall down with a tremendous crash."—*Von Spix*, vol. i. p. 243."

* Maximilian's Travels, p. 43.

from a light-yellow green, to one bordering on blue, and these are mingled again with red, brown, and a gradation of deeper shades almost to black. The "silver tree" is of a brilliant white; the head of the mangoa is brown. The Brazil-wood puts forth large flowers of a purple hue; "and I have seen," he says, "the vast mountain of Tengua clothed in yellow, from the multitude of its laburnums." The effect of the flowering parasitical plants he compares to "gay parterres in the air."

The same traveller witnessed, in 1816, on a comparatively diminutive scale, one of those magnificent conflagrations which not unfrequently take place in the forests, occasioned sometimes by lightning, sometimes by the carelessness of travellers.

"Fire," he says, "had seized upon an adjoining forest, and devoured about half a league square of it. Being to windward, and not incommoded by the smoke, I approached as near as the heat would allow me, or the embers suffer a well-broken horse to advance. It is not in my power, however, to communicate more than a very faint idea of the sublime picture. I was in the midst of several hundred stems, as large as the middle-sized British oak, all black and smoking, from whose smouldering remnants continually fell half-consumed branches, and smaller pieces of charred wood, which, broken and breaking others in their fall, formed a shower of sparks, rendered vivid by their passage through the air. The ground was covered with these charred arms, with embers, and with ashes, whence arose small spiracles of grey smoke, as if escaping through crevices from an immense furnace, hidden and burning beneath. At some little distance in front, the fire raged in all its fury. From the burning underwood, the flames rushed upwards in large sheets, which expired in the air, or seizing the dried leaves of those monarchs of the forest which had defied all former storms, instantly set the whole head in a blaze; and the crackling twigs formed a harsh counter to the surf-like roar of the flame below. While the fire spread itself, eating the forest all around, and became more active by every breeze, the remaining stumps in its immediate rear stood like piles of living coal, and seemed to writhe as under the influence of a liquid poison, creeping through their veins. The wintry appearance of those naked branches which preserved their station, and of the ground thickly strewn with ruins and black ashes, while flames surrounded me, and the heat of the atmosphere was almost intolerably oppressive, formed a contrast which cannot be described, an incongruous scene of desolation, which no art can represent."*

How this conflagration commenced no one thought it worth while to inquire: it seemed to pass almost unnoticed, as it had not endangered any farm or plantation. In the year 1796, a conflagration broke out on the summit of the Tengua, which lasted for nine months, and was mistaken by some persons for a volcanic eruption. It was at length quenched by the rains. The spot, M. Luccock says, is still marked by the diminutive size of the trees, and the colour of the foliage. In proportion as any tract is cleared of wood, the birds of prey become less numerous, while the smaller kinds increase and multiply. In one instance, this traveller noticed great numbers of small birds "like the linnet and canary,"† where the land had been partially brought under cultivation. The marshy mea-

* Luccock's Notes, &c., pp. 357, 8.

† The *canario* has the form, and almost the same colour, but not the song, of the native of the Canary Islands: it is the first among the small birds that announces the dawn of day. The *cardinal* (cardinal) resembles the linnet, but is a little larger. It derives its name from a small crimson cap, or hood, which covers part of the neck: its song is loud and pleasant.

dows abound with the hawk-heron, the American lapwing, and plovers and water-fowl in abundance.* The shining violet oriole, and the razor-billed black-bird are the common inhabitants of the fields and hedges.

The luxuriance and richness of the vegetable world in South America is ascribed by Humboldt to the great moisture which everywhere prevails, and which gives it an advantage over all other hot countries, forming a more happy and fertile contrast to those parts of Africa which lie within the same parallels of latitude. In many respects the climate, the soil, the varied surface, and the rich vegetation, seem to resemble more some parts of Asia Minor. But in that exuberance of evergreen foliage which forms the peculiar characteristic of the New Continent—in the number of its richly-wooded mountains, the sources of countless springs—in the abundance of large streams, in the character even of its sandless deserts and indomitable forests—the tropical regions of Brazil are almost pre-eminent to those of any other region.

The Amazonian forests, or those which stretch inland from the banks and tributaries of the Amazon, are especially remarkable for luxuriance of growth and the majestic grandeur of the trees. Many of the trees often grow to a great height, and remarkably straight upwards. Some of them are decked from the roots upwards with splendid flowers and parasites, and the trunks and boughs are frequently interlaced with innumerable runners or creeping vines.

On the borders of the Amazon the sylvan vegetation grows up and spreads forth in the greatest luxuriance. The vines, creepers, and parasites, twist around the trees up to their tops, then grow down to the ground, and then, taking root, run up again, spirally along the boughs, extending from the branches of one tree to those of another, interlace the whole forest. This interweaving of vines and parasites, is often impenetrable to birds or beasts. The stems of the vines are as thick as a man's arm; they are round, square, sometimes triangular, or even pentangular. The vines or parasites often grow in various forms of knots, screws, angles, or circles, and as tough as the most elastic fibrous substance. They constitute at times, as it were, a vegetable boa-constrictor, and twine, and press round, until they finally smother, and kill, the tree which so long supported them; and they occasionally remain erect, like a spiral column, after the trunk has mouldered away. This vegetable kingdom may be considered the peculiar country of monkeys.

Prince Maximilian, speaking of his crossing over the Sierra of Una, where thick gigantic forests grow on the acclivity, observes, that they are full of

* Mr. Luccock thus describes a species of heron, which he calls "the plumed succoo. This shy but interesting bird is nearly as large as the common stork, white, with a yellow bill and legs: it is distinguished by a tuft of feathers, which grows from a membrane between the scapulars, and reaches the whole length of the back, resembling the bird of paradise." Mr. Henderson enumerates the *cegonha* or stork, "similar to that of Europe;" the *garca* or heron; the *tuyuyu*, "the height of a man," which also lives on fish; the scarlet *guara*; and the rose-coloured *colhereira*, a delicate and beautiful bird, "the king of the morasses."

monkeys, parrots, and other Brazilian animals and birds. In particular, a small red-and-gold-coloured monkey (*simia rosalia*) was seen here, called the red *sahui*, or *marikina*, which is not found further north.

"Good Brazilian hunters," he remarks, "possess a wonderful talent for exploring these forests: their bodies being inured to fatigue, and the custom of always going barefoot, give them a great superiority in this employment. Their dress consists of a light shirt and cotton drawers. They often have a cloth jacket hanging over their shoulders, which they put on when it rains, or in the cool nights. The head is covered with a felt or straw hat. A leather belt, passing over the shoulder, holds the powder-horn and shot-bag, while the lock of the long fowling-piece is generally secured by the skin of some animal."

The interior of Brazil has been traversed by many scientific travellers. Among whom, Prince Maximilian's land journey from Rio de Janeiro to Bahia, through the interior and central parts; Von Spix, Martius, Von Langsdorff, Eschwege, Rodrigues, Martius, St. Hilaire, and Natterer are among the most distinguished.* The following are condensed sketches of the various sceneries and productions over which these enterprising men travelled.

A CAMPO, OR MOUNTAIN PLAIN.

Von Spix speaks of the transition from the dark, low forests to the free, open tracts, as producing a striking change of feeling; and as a contrast to the foregoing picture of a Brazilian forest.

"On these serene and tranquil heights, the noisy inhabitants of the wood are mute: we no longer hear the howling of herds of monkeys, the incessant screams of innumerable parrots, orioles, and toucans, the far-sounding hammering of the woodpeckers, the metallic notes of the uraponga, the full tones of manakins, the cry of the hoccoes, jacues, &c. The more numerous are the humming-birds,

* St. Hilaire, the author of the "*Plantes Usuelles*," became fully acquainted with the Brazilian character, and for a long time identified himself with the inhabitants of the *sertoes*. Mr. Natterer, a German naturalist, spent seven years in traversing the interior. The scientific mission to Brazil, sent out by the King of Bavaria, was directed and executed by Doctors von Spix and Martius. They travelled from Rio de Janeiro through San Paulo, Minas Geraes, and Goyaz, to Maranham; thence by sea to Pará, they ascended the Amazon as far as Tabatinga, which is near Tavari, the western limit of the Brazilian territory. They made numerous lateral excursions on the rivers Negro, Japury, and other streams, and descended the Amazon to Pará, whence they returned to Europe. They have presented to the world valuable works, the result of their observations.

The scientific commissioners appointed by the Emperor of Russia to explore Brazil, was on a larger scale; but far less fortunate. The Baron von Langsdorff, who had long resided at Rio Janeiro in a diplomatic capacity, was placed at its head, and directed its plans with great energy. This Russian expedition proceeded from Rio de Janeiro through San Paulo and Matto Grosso. It arrived at the sources of the Madera, when the party divided, and pursued different routes, in order to explore as wide an extent of country as possible before reaching their fixed destination, the city of Pará. The toils and hardships of the journey brought on sickness, and several died.

One very unwise regulation of the expedition, prohibited any member of the expedition to publish his journal or notes until after those of the director, if living, had been edited. The Baron von Langsdorff returned to Europe in a state of insanity, caused by sickness and exposure in the wild regions over which he had travelled. In that state, we are informed, he survives; and we have, whether from this or from any political cause, no account of the Russian travels and observations in Brazil. M. Riedel, one of his coadjutors, who returned to Rio de Janeiro, and remained there, is considered better acquainted with the botany of Brazil than any other person.

buzzing like bees round the flowering shrubs; gay butterflies fluttering over the rippling streams; numerous wasps flying in and out of their long nests hanging suspended to the trees; and large hornets (*morimbondos*) hovering over the ground, which is undermined to a great extent with their cells. The red-capped and hooded fly-catcher, the *barbudos* (the barbet), little sparrow-hawks, the rusty-red or spotted *caboré* (Brazilian owl), bask on the shrubs during the heat of noon, and watch, concealed among the branches, for the small birds and insects which fly by; the tinamus walks slowly among the pine-apple plants, *enapupés* and *nambús* in the grass; single toucans, seeking berries, hop among the branches; the purple tanagers follow each other in amorous pursuit from tree to tree; the *caracarà* (*falco brasiliensis*), flying about the roads quite tame, to settle upon the backs of the mules or oxen; small woodpeckers silently creep up the trees, and look in the bark for insects; the rusty thrush, called *João de Barros*, fearlessly fixes its oven-shaped nest quite low between the branches; the siskin-like creeper slips imperceptibly from its nest (which, like that of the pigeons, is built of twigs, and hangs down from the branches to the length of several feet), to add a new division to it for this year: the *cáoha*, sitting still on the tops of the trees, looks down after the serpents basking on the roads, which, even though poisonous, constitute its food; and sometimes, when it sees people approaching, it sets up a cry of distress, resembling a human voice. It is very rarely that the tranquillity of the place is interrupted, when garrulous orioles and little parrots and parroquets, coming in flocks from the maize and cotton plantations in the neighbouring wood, alight upon the single trees on the campos, and with terrible cries appear still to contend for the booty; or bands of restless hooded cuckoos, crowded together upon the branches, defend, with a noisy croaking, their common nest, which is full of green-speckled eggs. Alarmed by this noise, or by passing travellers, numerous families of little pigeons (*rolas*), often no bigger than a sparrow, fly from bush to bush; the larger pigeons (*amarzoga* and *troquase*), seeking singly among the bushes for food, hasten alarmed to the summits of the neighbouring wood, where their brilliant plumage shines in the sun; numerous flocks of little monkeys run whistling and hissing to the recesses of the forest; the *cavies*, running about on the tops of the mountains, hastily secrete themselves under loose stones; the American ostriches (*emus*), which herd in families, gallop at the slightest noise, like horses through the bushes, and over hills and valleys, accompanied by their young; the dicholopus (*siriemas*), which pursues serpents, flies, sometimes sinking into the grass, sometimes rising into the trees, or rapidly climbing the summits of the hills, where it sends forth its loud, deceitful cry, resembling that of the bustard; the terrified armadillo (*tatú*), runs fearfully about to look for a hiding-place, or, when the danger presses, sinks into its armour; the ant-eater (*tamanduá*), runs heavily through the plain, and, in case of need, lying on its back, threatens its pursuers with its sharp claws. Far from

all noise, the slender deer, the black tapir, or the pecari, feed on the skirts of the forest. Elevated above all this, the red-headed vulture (*urubú*) soars in the higher regions; the dangerous rattle-snake (*cascaoel*), hidden in the grasses, excites terror by its rattle; the gigantic snake sports suspended from the tree with its head upon the ground: and the crocodile, resembling the trunk of a tree, basks in the sun on the banks of the pools. After all this has passed, during the day, before the eyes of the traveller, the approach of night, with the chirping of grasshoppers, the monotonous cry of the goat-sucker (*João corta pão*), the barking of the prowling wolf and of the shy fox, or the roaring of the ounces, completes the singular picture of the animal kingdom in these peaceful plains.* The foregoing constitutes a remarkably descriptive picture of scenery, and its natural inhabitants.

In travelling from San Paulo to Villa Rica, there is a gradual change in the general appearance of the country, after passing the boundary which divides the waters flowing south to the Rio Grande, from those which run northwards, and fall into the Rio de San Francisco. "While the Rio Grande, with the thundering noise of its fall, here takes leave of its native mountains, to flow to the lower countries towards the west, it at the same time prepares the wanderer for grander scenes of nature, which await him as he advances further to the north. The mountains become more lofty and more steep, the valleys deeper; massive rocks, on the summits or in the vale, more frequently interrupt the verdant slopes and plains; the streams flow with a more rapid course. Sometimes the traveller finds himself on elevated spots which command a sublime prospect of manifold insulated mountain tops and profound valleys; sometimes, he is enclosed between steep and threatening walls of rock. All objects assume more and more the features of a romantic Alpine country."

In a north-easterly direction along the ridge of hills connecting the Sierra de Capivary with the Sierra de Viruna, the country is described by Dr. Von Spix as poetically rural, but lonely and desolate. Extensive forests are still seen extending along the declivities and valleys. Near the Morro de Bom Fim, the last of these high mountains, the traveller crosses the Rio das Mortes, winding through a broad, swampy valley, and bearing its dark waters to the Rio Grande, which it joins about seventy miles west of San João d'el Rey. It was in this valley that two parties of Paulistas, quarrelling about gold, engaged in a sanguinary contest, from which the river has derived its name.

Of the natural edible products, there are various and delicious fruits, as oranges, mangoes, grapes, &c.

The *cocoa tree* is one of the most generally useful trees in Brazil. Mr. Kidder says, "The cocoa is truly the staple vegetable, and although many of the uses to which it may be applied are unknown or unpractised here, yet it literally

* Von Spix.

furnishes the people with meat, drink, fuel, houses, and commerce. Besides the sale of the raw nut, the pulp is converted into oil, the shell into dippers, and the fibrous husk into cordage ; while all know the value of its water as a beverage. At the same time the leaf furnishes materials for the construction of an entire habitation. It is wrought into baskets, it makes fences, and when dried may be used for writing, while its ashes yield potash. The terminal bud is a delicate article of food ; the juice of the flower and stem contains sugar, and may be fermented into wine, or distilled into spirits ; and, finally, the case of the trunk or stem is converted into drums, or used in the construction of buildings, while the lower extremity is so hard as to take a beautiful polish, after which it resembles agate."

Those who mount the trees to pluck the fruit, carry a *fonce*, or sharp bill-hook, with a short handle, to cut the stems. It is twisted into the girdle, and the bearer, if expert, places simply his hands and feet against the side of the tree and *walks up*, if not with the agility of a monkey, certainly with incomparable self-composure.

The *cashew* tree, or *cajueiro*, is abundant on several parts of the coast and islands. Southey calls it the finest of the American trees. "How beautiful," he says, "it is to behold in its pomp, either when it is re-clothing itself, in July and August, with the brightest verdure of its leaves, or when, during our northern autumn, it is covered with white and rosy-tinged blossoms ; or, finally, in the three following months, when it is enriched with its ruby and golden fruits, which hang amid its leaves like pendent jewels ! Its leaves have an aromatic odour, its flowers are exquisitely fragrant, its shade deep and delightful. A gum exudes from its trunk nothing inferior to that of Senegal, and in such abundance as to have the appearance of rain-drops upon the tree. This gum was used by the Indians as a medicine, being pounded and dissolved in water. This admirable tree is not common in the interior, but towards the coast whole tracts of country, which would else be barren, are covered with it ; and the more sandy the soil, and the drier the season, the more it seems to flourish. The possession of a spot where it grew abundantly, used to be of such importance as often to cause war among the natives. The fruit somewhat resembles a pear in shape, but is longer. It is spongy and full of a delicious juice ; in any form it is excellent, whether in its natural state or preserved. What a blessing would this tree be to the deserts of Arabia and Africa."

On some of the fazendas are cultivated, promiscuously, sugar-cane, mandioca, cotton, rice, and coffee. Around the farm-house, which is the centre, are usually situated out-houses for negroes, store-houses for the staple vegetables, and fixtures for reducing them to a marketable form.

The *engenho de cachassa* is an establishment where the juices of the sugar-cane is expressed for distillation. On most of the sugar estates there are distil-

leries, which make the molasses that is separated from the sugar into the rum, called by the Portuguese *cachassa*. The apparatus for grinding the cane is generally rude and clumsy.

The *Jatropha manihot* L., or *mandioca*, being the principal farinaceous production of Brazil, is deserving of particular notice. Its subsistence combines deadly poison with highly nutritious food. It is indigenous to Brazil, and was known to the Indians long before the discovery of the country. Southey remarks, "If Ceres deserved a place in the mythology of Greece, far more might the deification of that person have been expected who instructed his fellows in the use of mandioc."

The *farinha de mandioca*, or mandioc flour, was prepared by the slaves, scraping it into a fine pulp with oyster shells, or with an instrument made of small sharp stones set in a piece of bark, so as to form a kind of rasp. The pulp was then rubbed or ground with a stone, the juice carefully expressed, or finally evaporated by heat. The work of thus preparing it was considered pernicious to health, and the slaves employed mixed, as a corrective, the flowers of the *nhambi* and the root of the *annato* in their food. The natives prepare it as above, and in various other ways.

The Portuguese invented mills for preparing the mandioc flour. They generally pressed it in cellars, and places where it was least likely to occasion accidental injury. It has been asserted that a white insect was generated by the juice; so venomous, that the native women sometimes poisoned their husbands, and slaves their masters, by mixing it in their food. A poultice of mandioc, with its own juice, was considered a cure for *imposthumes*. Mr. Kidder says it was administered for worms, and was applied to old wounds to eat away the diseased flesh. For some poisons, also, and for the bite of certain snakes, it was esteemed a sovereign antidote. The simple juice was used for cleaning iron. The poisonous quality is confined to the root; for the leaves of the plant are eaten, and even the juice might be made innocent by boiling, and be fermented into vinegar, or inspissated till it became sweet enough to serve for syrup.

The root, after being removed from the soil, cannot be preserved from corruption for three days; the slightest moisture ruins the flour.

The native mode of cultivating mandioca was by cutting down the trees, letting them lie till they were dry enough to burn, and after the burning of the wood, then planting the mandioca between the stumps.

They ate it as flour, and the mandioc supplied them also with a spirituous drink. They prepared the liquid by slicing the roots, which were then boiled until well softened. The young women then chewed and threw them into a vessel, which was filled with water; the liquid and pulp were then boiled, and afterwards poured into large earthen jars, half buried in the floor of the dwelling.

The jars were closely stopped, and in two or three days fermentation commenced. When the banquetting day arrived, the women kindled fires around the jars, the liquid when heated, was served round in gourds: the men dancing and singing as they received and emptied, at one draught, the contents of a gourd. They ate nothing at these orgies, but continued drinking until all the liquor in one house was exhausted, and then resorted to the next, till they had drank all the liquid in the village. These orgies were held about once a month. De Lery says he witnessed one which lasted three days and three nights.

Mandioca is difficult of cultivation, and requires from twelve to eighteen months to ripen. As its roots have a great tendency to spread, it is planted in large hills, to counteract its spreading, and to render the soil more dry and congenial to its growth. The roots, when dug up, are of a fibrous texture. The best process of preparation is first to boil them, then to separate the rind, and then to rasp the roots on a circular grater turned by water-power or other power. The raspings should then be put into sacks, and then placed, several together, under a screw-press to squeeze out the poisonous liquid. The dry mass is then pounded fine in mortars, and transferred to ovens, or concave plates, heated underneath. The flour is then rapidly stirred about until quite dry. The farinha, when well made, is white and granular. It is eaten at all Brazilian tables, and formed into a great variety of nutritious dishes. The residuum deposited by the juice of mandioca, after standing a short time, is dried, and then constitutes tapioca.

The well-known colouring matter, *annato*, is a product of the tree known to botanists as the *bixa orellana*. This tree is of moderate size, with red and white flowers. Its colouring matter was used by the aborigines to paint their persons.

Annato is the oily pulp of the seed, rubbed off and then left to ferment. It is afterwards rolled into cakes, weighing from two to three pounds, to be exported. *Cacao* is a common production of Para and other parts. It is made from the seeds of the *theobroma cacao*.

The fruit called the Brazil-nut is only produced in the northern parts of the empire. It grows in great abundance spontaneously in the forests of the Amazon. The Portuguese call it "*Castanha do Maranhão*." It grows upon the lofty branches of a majestic tree, the *bertholletia excelsa*.

The first attempts to cultivate Chinese tea, was about 1819, when the Count of Linhares, prime minister of Portugal, brought from the interior of China, several hundred immigrants who were acquainted with the whole process of growing and preparing the tea-plant.

These colonists became discontented, and have nearly disappeared. From whatever cause, whether from the soil or climate of Brazil, or to imperfect preparation of the tea-leaf, when grown, the Chinese plant did not yield good tea.

The tea-plant is now grown chiefly as a pretty shrub ; and seeds or cuttings are gratuitously given at the *imperial* botanical garden to those who apply for them.

The Paulistas and others have since attempted the cultivation of the tea-plant, and have succeeded to some extent. We have had several samples of their growth, but none equalled good Chinese tea. The cost of production is said to be greater than the price at which better tea can be imported from Canton. The growers are, however, sanguine in the belief that, ultimately, they can produce the tea, in price and in quality, so as to compete with China in foreign markets.

Coritiba, on the route to Rio Grande do Sul, is an aboriginal name, signifying many pines, and indicating the prevalence of the pine tree throughout the whole region. The fruit trees of Europe also flourish there in great perfection.

Coritiba, is the principal town within the extensive district to which it gives name, and which is said to abound in mines of gold and diamonds. The district has also many estates appropriated to the rearing of cattle, horses and mules, and the cultivation of the products of the earth. It is, however, more renowned for another product, the tea-herb of *Paraguay*, or *Matte*, the *cassine gongonha* (Martius), or the herb of Paraguay. This, when pulverised, is called *matte*, and is much used in the Spanish republics of South America. Raw hide cases of it are exposed for sale in nearly every town of Brazil. The infusion is prepared in a bowl. A small quantity of the leaf, mixed with sugar, is suffered to stand a short time in cold water ; boiling water being added, it is immediately ready for use. As the particles of leaf swim in the tea, it is sipped through a tube, with a fine globular strainer at the end, immersed in the decoction. The natives, who labour all day, are said to be immediately refreshed by this tea. In Chile, Peru, &c., it is a constant beverage. It grows spontaneously in the districts of Coritiba and Parangua.

The natural growth of the soil of Brazil, it will be observed, is exceedingly varied. The agricultural products will be found further noticed in the brief descriptive sketches of the respective provinces of the empire, and those which are most important in commerce will appear stated in the Tables of Exports.

Wild Animals—Live Stock.—European animals have succeeded. There are great herds of cattle and horses in the countries south of 25 deg. latitude, where they wander about nearly in a wild state. In other parts they are reared, but are less abundant ; on the plains mules and asses are preferred to horses. Pigs are abundant only in some parts of the plains. Sheep are not numerous, and their wool is of inferior quality. The wild animals common to South America are found in Brazil, with the exception of llamas and guanacoes, and of the puma and spectacled bear. Among the rapacious animals are the hyena, tiger-cat, the ferocious *saratu*, the jaguar, a very fierce beast, ounces, and wild hogs. The tapir is large, timid, and feeds like a horse, but is amphibious, and will

remain a long time at the bottom of rivers. The flesh is said to resemble that of the ox. The wild animals killed for food are the tapir, three species of porcupine, five species of deer, several species of monkeys, the Brazilian hare, five species of armadillo, alpacas, the agoutis, and the wild boar. There are several kinds of wild bees.

Birds.—The feathered tribes of Brazil are of the most richly varied colours. Emus, or Brazilian ostriches are numerous on the table-land, as well as nearly all the other birds of South America, especially toucans, vultures, tanagras, parrots, the Balearic crane, humming-birds, and several species of pigeons.

Fish.—Whales appear along the coast as far north as 12 deg. south latitude, and the *Physeler macrocephalus* (Linn.) is found south of 30 deg. south latitude. The whale fishery is carried on at different points of the shore, by the inhabitants, and on the Brazil bank by the Americans. The *garopa* is met with north of 15 deg. south latitude, and great quantities are annually caught and exported. Several kinds of fish are caught in the Amazon, and dried for exportation. The huge manati is still common in that river, and in some of its tributaries: several species of turtle are also found in the Amazon, and the mantega or fat substance extracted from the eggs of the turtle, is an important article of commerce. The boa constrictor, or great *cobras*, said to be sometimes thirty feet long and as thick as a man's body, will gorge a deer, and, it is even said, an ox. The corral snake, the janacara, &c., are among the other reptiles, which are numerous. Mosquitoes, and various insects, are, in the low districts, very annoying.

The *vacca marina*, (*Peixe boi*), or fish ox or *manati*, never leaves the water, and it feeds principally upon a water plant (*cana brava*) that grows or floats on the borders of the rivers. It raises its head above the water to respire, as well as to feed upon this plant. It has two small fins situated near its head. The udders of the female are under the fins. The manati is considered the largest fish or animal inhabiting fresh-water, being sometimes seventeen feet long and two or three feet thick above the middle; its eyes are very small, and the opening of its ears are scarcely perceptible. Its skin is thick, and so hard as to be nearly proof against a musket ball. The Indians made shields of it in war. Its fat and flesh were always considered delicious by the natives. They smoked or dried it in place of beef.

The *turtle egg butter* of the Amazon (*manteiga da tartaruga*) is a substance peculiar to Central and South America. At certain seasons of the year the turtles appear by thousands on the banks of the rivers, in order to deposit their eggs upon the sand. The noise of their shells striking against each other while rushing inwards, is said to be sometimes heard at a great distance. Their next march begins at dusk, and ends with the break of morn, when they return to the water. They continue nestling in this manner until each turtle has deposited from sixty to one hundred and thirty or forty eggs."

During the day-time the inhabitants collect these eggs, and lay them up in

heaps. These piles are often twenty feet in diameter, and of a corresponding height. While fresh they are thrown into wooden canoes, or other large vessels, and broken with sticks, and pressed by treading with the feet. Water is then poured on, and the vessels are exposed open to the sun. The heat brings the oily matter to the surface, when it is skimmed off with cuyas and shells. The oil is then exposed to a moderate heat until ready for use. When purified it has the appearance of melted butter. It retains a fishy taste, but the natives are accustomed to its use, and like it as well as Europeans do butter. It is carried to market in earthen jars. In former times it was estimated that nearly 250,000,000 of turtles' eggs were annually used in making mantega.

The Brazilian emu, or ostrich, is remarkable for strength and swiftness. Mr. Luccock and his party started an emu, and putting their horses to their utmost speed, they gave it chase.

"The bird," he says, "quickly left us far behind, then closed its wings and stalked on in careless security. Though the neighbouring sands are the natural haunt of these birds, they were now numerous on the plains, having been driven hither, I suppose, by dry weather; we had in consequence several chases of the same kind, all of them equally fruitless. On turning the corner of a wood we suddenly came within thirty yards of an emu, followed by about sixty young ones, which were, probably, several collected broods. She marched off with a stately step, carrying her head in a sort of semicircle, and looking at us first with one eye then with the other. We again followed at full gallop; but, as the pursuit continued the distance sensibly increased. The young birds clustered together, fluttered much, and advanced with evident haste; the pace of the old one was dignified and steady; she showed no marks of weakness, fear, or stupidity; on the contrary, while concerned for the safety of her charge, she seemed desirous to save them from unnecessary fatigue.

"I kept one of these birds for some time within a spacious stockado, until it became familiar and occasionally impertinent; and he allowed me to stride over his back, and could just support my weight. Mounted by a boy of twelve years of age, he could run, and was easily guided by turning his head to the direction in which the rider wished him to proceed."

Cattle Grounds.—North of the Gonzales, there extends towards the north, between the Passo dos Negros and the *Lagoa dos Patos*, a broad patch of swampy land, "the accumulated sediment of ages." In these fens are several large farming establishments; that of Pellotas, which stands about six or seven miles above the mouth of the river of that name, is said to occupy ten square leagues, a moderate extent for a grazing farm in Rio Grande. Towards the west the country assumes a different aspect. An extensive tract, famous for its fine cattle, is comprehended under the name *Charqueados*, derived from the "*charqued*" beef which is prepared in this district for exportation.

Mr. Luccock says, "that in one year an individual, Joze Antonio dos Anjos slaughtered 54,000 head of cattle, and charqued the flesh. The piles of bones which lay in his premises far surpassed my utmost conceptions; and there were thousands of *urubues*, the vulture of South America, flying round and feeding on the offal. During the slaughtering season it is not uncommon for large packs of dogs to make their appearance and assist the vultures in picking the bones; and it is said that the ounce will do the same."

In the beginning of the seventeenth century, the province of Rio Grande do Sul, was covered with cattle, notwithstanding the devastation made among the herds by the Indians and the ounce. The conquerors of the province then commenced a system of wanton destruction, — directed principally against the calves. One of which seldom sufficed for the dinner of two persons. If one wished for a tongue, rather than divide it, they would slaughter another calf; some would kill an animal in the morning in order to breakfast off broiled kidneys, and not to be incommoded by carrying home any part of the meat, would kill another for dinner. At length the Spanish and the Portuguese governors interfered; and an edict was passed by the governor of Monte Video, about the year 1650, prohibiting the slaughter of calves and of all oxen under five years old. This partly checked the destruction; but in some parts, owing to the warfare carried on near the banks of the Plata, the charqued beef has at times been very scarce.

In the beginning of the present century, there were in Rio Grande, 539 proprietors of land, consisting of *fazendeiros*, farmers, and *lavradores*, husbandmen. The latter, who bred only what was necessary for their own consumption, possessed generally about two square leagues of land: the former farmed from eight to ten leagues; and some of these fazendas states were reported to extend to a hundred square leagues, or nearly 600,000 acres.

To each three square leagues are allotted 4000 or 5000 head of cattle, six men and a hundred horses.* This proportion of horses is large; but they cost nothing in keeping, and are turned out on the plains; on these estates no one, not even a slave, travels any distance on foot. About a hundred cows were allowed for the supply of milk, butter, cheese, and veal, to a fazenda of average size. Hogs are usually little taken care of; they root up the earth, devour reptiles, and subsist, also, on the waste parts of slaughtered cattle. The sheep are few and ill-made, with short, ordinary wool. The wool is used partly on the skins, as saddle covers, &c., or stuffing mattresses, &c.

"The breed of sheep," Mr. Henderson considered, "would, if attended to, much exceed that of cattle, in consequence of their generally producing two at a

* In a fazenda of three leagues, it is computed, Mr. Henderson says, that 1000 young cattle, male and female, are branded, or marked, annually; the number sent off or killed, may be judged of from this calculation.

birth; they, however, are not numerous, few farmers possessing 1000 head, and the major part not any." The *fazendeiros* breed also droves of horses and mules.

From the Rio Ypanema, grassy campos extend southward with little interruption to Coritiba, and into the capitania of Rio Grande, in the whole of which extensive tract the same system of farming is still followed, that is described by Dr. Von Spix as follows:—

"Every landholder possesses, according to the extent of his farm, from several hundred to 2000, nay, even 40,000 head of cattle. They generally reckon from 3000 to 4000 head on an estate which has two square miles of good pasture. All these roam at liberty in a wild state; but, every farmer keeps besides, as many tame draught oxen and cows as he requires for the purposes of agriculture, and for milk, which is partly made into cheese. The attendance on the wild cattle gives but very little trouble; all that is required is, to brand them with the mark of the owner, and to catch the animals intended to be slaughtered. From four to six servants, under the direction of a chief cowherd, perform all these services; they prevent the herds from straying beyond the boundaries, and defend them from the attacks of the ounces, wolves, and wild dogs. These people are almost always on horseback, as their office compels them to ride twenty miles or more in a day. Every year, the whole herd is collected at different times in a place in a high situation, and sometimes fenced in. On this occasion, the mark of the owner is branded on the hind quarter of the beasts one year old, of which they reckon 1000 annually for a herd of 5000 or 6000. Those of four years old and more are selected for slaughter. The catching of these, frequently a troublesome and dangerous employment, is executed here, as in the *pampas* of Buenos Ayres, by means of long leathern nooses, lassoes, which the farmers' servants manage with considerable dexterity.* The tame cattle are kept in the vicinity of the fazenda, run free in the meadows during the day, and are only shut up in the enclosures during the night. The flesh of the tame cattle is preferred to that of the wild, because, from their undisturbed and more quiet way of life, they grow fat sooner, and with less fodder. The pasture being so good, their milk is excellent; but a cow gives only a third part of the quantity that good milch cows give in Europe. The hide is always the most valuable part of the cattle: it is stripped off, stretched upon the ground by means of short pegs, a little salted, and dried in the sun. The flesh, cut into thin strips, rubbed with

* Mr. Mawe, describing this process as practised by the peons of Monte Video, says, "The dexterous mode in which the peons catch their cattle, by throwing a noose over them, has been frequently detailed, but certainly no description can do full justice to their agility. They throw with equal precision and effect, whether at full gallop or at rest. Their method of catching horses, by means of balls attached to leather thongs, is similar, but more unerring."—*Travels in Brazil*, p. 29.

salt, and dried in the air, is an important article of exportation from the harbours of San Paulo and Rio Grande do Sul, to the cities in the north ; particularly to Rio de Janeiro, Bahia, Pernambuco, and Maranhão, where, under the names of *Carne seca do Sertão*, *Passoca*, or *Carne charquada*, it constitutes an essential part of the subsistence of all the Brazilians, but especially of the negro slaves.

“ Besides the breeding of oxen, that of horses and mules likewise occupies several farmers in the capitania of San Paulo, but is carried on upon a far more extensive scale in Rio Grande do Sul. The horses of San Paulo are of a middling size, of slender make, and, if they are attended with care, acquire an elegant carriage, and become excellent racers. In general, twenty or thirty of those wild animals herd together, and hardly ever separate. The animals, when taken (by means of the long nooses), sometimes trembling with fear, sometimes full of impetuous fury, endeavour, by the strongest contortions and the most desperate leaps, to defend themselves against the riders. When the latter have succeeded in holding an animal fast by the ears and lips with a pair of tongs, in putting a halter over his head, and a sheep-skin by way of saddle on his back, one of the servants mounts him, and endeavours to overcome the obstinacy of the horse by means of the whip. After many violent motions and leaps, it is at length so far subdued, that it runs furiously away with its rider, and after a long course, it in some degree yields to the bridle. After being thus humbled, it stands still with its head hanging down, on which all the others separate from it. The next day, the same exercise is repeated ; and in a few days more, the horse is broken and fit for riding. The common Paulistas, and particularly the *piãos* (the herdsman's servants), make use of a very small flat, wooden saddle, which is often not even covered with leather. Their stirrups are so small that they will only admit the great toe: the spurs are fastened to the naked heel. The dress of the *pião* consists of a short jacket, narrow trousers, and a flat round hat, fastened with a strap, altogether of brown leather, made of deer or capivara hides, and is very well adapted to protect him against the thorny hedges through which he must force his way, when pursuing wild animals.

“ The wild horses are most frequently of a brown colour, very rarely white or piebald, and by their disproportionably short, thick heads and small stature, generally betray their extra-European breed. The mules are here more handsomely made animals than the horses: they are commonly equal in size to the European horse: their colours are black, brown, fallow, or striped like a zebra. They are preferable to the horses, especially on long journeys, because they can better endure hunger and thirst, and carry with greater security heavier burdens.”

The *Guachos* of Buenos Ayres are not more expert on horseback, and in the use of the lasso, than are these men, whose occupation, from childhood, is the care and culture of the herds of cattle, which roam their vast campinas or prairies.

It has been estimated that, in the province of Rio Grande do Sul, not mentioning parts of Santa Catharina and San Paulo, which are devoted to the same purposes, about 400,000 cattle have been slaughtered annually, for their hides and flesh, while as many more are driven northward for home consumption. Most of the *carne secca*, or jerked beef, in common use throughout Brazil, is prepared here. Stacks of this meat, like cords of wood, are piled up in the provision houses of Rio de Janeiro.

The Brazilians in preparing pork, skin off all the fat taking the lean meat for immediate use, and throwing the bones away. The fat part is rolled up and pressed into a basket, with a little salt sprinkled over and around it, it is then called *toucinho*, and carried great distances to market.

CHAPTER IV.

MINERALS OF BRAZIL.

THE mineralogy of Brazil, can only as yet have been very imperfectly explored. Gold and precious stones have been the temptations, seized upon with the most rapacious avidity, though not always with success. The gold mines of Jarugua, in San Paulo, were the first discovered in Brazil. They are distant a few leagues from the city of San Paulo, which owes its origin to the mineral districts. They were so productive in the beginning of the seventeenth century, as to impart to the district the name of the Brazilian Peru. They were afterwards abandoned, but worked in about the year 1807, and Mr. Kidder says, they now (1844), cease to be regularly wrought, and have given place to the gold of Minas Geraes.

Gold occurs on both sides of the Sierra dos Vertentes, and is found in almost all the rivers which extend from that range. There are also gold mines in the vicinity of Villa Rica, and at Congo Soco, near the Villa de Sabara, in Minas Geraes. Little silver has been found, but there are traces of copper, tin, and quicksilver. Iron is abundant, and it has lately been smelted. Diamonds occur in the deposits of several rivers, but it is not lawful to collect them, except on account of the government in the authorised diamond districts, especially that which lies east of the Rio San Francisco, under 8 deg. south latitude, those of the Rio Pardo Mandongá, and that of the river Jequitinhonha, an affluent of the Rio del Belmonte, which traverses the district. The great diamond found in the River Abaeté, is considered the largest known, and weighed 138½ carats. Topazes

are found in several places. Salt is abundant, and the grounds much resorted to by the cattle and wild animals. There is a salt region on both sides of the Rio de San Francisco, which has an average width of from eighty to 100 miles; and another at the western extremity of the Sierra dos Vertentes, in the Sierra de Agua-pehy. In both salt is prepared in large quantities.

In 1718, the gold mines of Matto Grosso were discovered, and in 1836, a route was opened into those of Goyas. In 1746, a route was opened between Cuyaba, in Matto Grosso and Para by the tributaries of the Amazon, which rendered it less necessary to ascend by the broken, rocky navigation of the Tiete.

The earth washed for gold, Dr. Von Spix describes as "a ferruginous sandstone conglomerate;" which agrees with Mr. Mawe's account. "The soil," he says, "is red and remarkably ferruginous. The gold lies, for the most part in a stratum of rounded pebbles and gravel, called *cascalhão*, incumbent on the solid rock. In the valleys, where there is water, occur frequent excavations, made by the gold-washers, some of them fifty or 100 feet wide, and eighteen or twenty feet deep. On many of the hills where water can be collected for washing, particles of gold are found in the soil, scarcely deeper than the roots of the grass."

The mode of obtaining the gold, Mr. Mawe thus describes. "Where water of sufficiently high level can be commanded, the ground is cut in steps, each twenty or thirty feet wide, two or three broad, and about one deep. Near the bottom, a trench is cut to the depth of two or three feet. On each step stand six or eight negroes, who, as the water flows gently from above, keep the earth continually in motion with shovels, until the whole is reduced to a liquid mud, and washed below. The particles of gold contained in this earth descend to the trench, where, by reason of their specific gravity, they quickly precipitate. Workmen are continually employed at the trench to remove the stones, and clear away the surface, which operation is much assisted by the current of water which falls into it. After five days' washing, the precipitation in the trench is carried to some convenient stream to undergo a second clearance. For this purpose wooden bowls are provided, of a funnel shape, about two feet at the mouth, and five or six inches deep, called *gamellas*. Each workman, standing in the stream, takes into his bowl five or six pounds of the sediment, which generally consists of heavy matter, such as granular oxide of iron, pyrites, ferruginous quartz, and often more precious stones. They admit certain quantities of water into the bowls, which they move about so dexterously, that the precious metal, separating from the inferior and lighter substances, settles to the bottom and sides of the vessel. They then rinse their bowls in a larger vessel of clean water, leaving the gold in that, and begin again.

"The washing of each bowlful occupies from five to eight or nine minutes. The gold produced is extremely variable in quality, and in the size of its particles.

The operation is superintended by overseers, the result being important. When the whole is finished, the gold is placed upon a brass pan, over a slow fire, to be dried, and at a convenient time is taken to the permutation office, where it is weighed, and a fifth reserved for the government. The remainder is smelted with muriate of mercury, then cast into ingots, assayed, and stamped according to its intrinsic value."

Bars of uncoined gold were formerly common in the circulating medium of Brazil. But at present specie of all kinds, except copper, is scarce, and seldom met with, except at exchange offices.

The gold mines of Villa Rica, in Minas Geraes, are in a sort of schistous clay, resting on granite, gniess, or sandstone, laminated or solid—the gold being scattered in small particles amid the superjacent schist and clay. The town of Villa Rica is situated at the junction of several streams, whose waters have only one outlet, by a narrow chasm cut by their force through the surface down to the more firm component parts.* The extent of a small plain above the town, supposed to have been once a lake, is from thirty to forty acres, and it is connected, by narrow passes, with others of a like size. The mountains surrounding this supposed ancient lake, rise from 700 to 1000 feet above its level; and on the declivity of the most northerly of them the town is built. In the sides of all of them much gold is supposed still to exist, notwithstanding the quantity which has been washed down or gathered from them.

Mr. Mawe says, "Wherever a natural stream trickles down, its bottom is frequently and carefully searched; particularly where the current has met with any check, for there the precious metal is commonly detained. In parts where nature has provided no water, pits are dug and flanked with strong walls, or stockades, through which a stream is turned from a distance. The surplus, running over the edge of the embankment, is generally received into a second pit below; sometimes into a third. At proper seasons, the pits are cleared of the water, the sediment is taken out, and treated as before mentioned. Numerous drifts also have been run horizontally into the softer parts of the mountain, until they entirely

* M. de Humboldt, in his "Geognostical Essay on the Superposition of Rocks," has the following remarks on the quartz-rock formation:—"On the table-land of Minas Geraes, near to Villa Rica (according to the excellent observations of M. d'Eschwege), a micaslate, containing beds of granular limestone, is covered by primitive clay-slate. On this latter rock reposes, in conformable stratification, the chloritous quartz which constitutes the mass of the Peak of Itacolumi, 1000 toises above the level of the sea. This formation of quartz contains alternating beds; 1. of auriferous quartz, white, greenish, or striped, mixed with talc-chlorite; 2. chlorite slate; 3. auriferous quartz mixed with tourmaline; 4. specular iron mixed with auriferous quartz. The beds of chloritous quartz are sometimes 1000 feet thick. The whole of this formation is covered with a ferruginous breccia, extremely auriferous. M. d'Eschwege thinks, that it is to the destruction of the beds we have just named, and which are geognostically connected, that the soil which is worked by means of washing should be attributed, containing gold, platina, palladium, and diamonds (Corrego das Lagens), gold and diamonds (Tejuco), and platina and diamonds (Rio Abaeté). The decomposed chlorite-slate, from which the topaz is procured, belongs to this formation."—See "Humboldt on the Superposition of Rocks," London, 1823. pp. 117—18.

perforate the coating of schist or clay, and reach its solid core, while the water oozing through the mass above, is received into basins, together with the metal which it may convey."

Dr. Von Spix was conducted by M. Von Eschwege, the director-general of the mines of Brazil, to the eastern declivity of the Morro of Villa Rica, which has yielded the greatest abundance of gold. "From the southern hill of the mountain," he says, "we passed through several gardens ornamented with fuchsia, near to the Hospicio de Jerusalem, and by the side of a deep trench to a naked ravine irregularly rent, and full of masses of rock which had fallen down, presenting a picture of wild desolation. How great was our astonishment, when our friend signified to us that this was the rich gold mine of Villa Rica! Sieves and raw ox-hides were placed at certain distances, in trenches full of water, conducted from the summit; the first sieve to stop the coarser sand, and the latter to catch the gold dust in the hair, which stands erect.* Here and there we also saw detached trenches, in which the auriferous mud or sand collects. As soon as the rainy season commences, these simple preparations are put in motion. The former possessors always had their mine worked by several hundred slaves, and derived immense profit from it. At present, however, it seems to be much impoverished, so that but few gold-washers are employed in it, and the work is mostly left to free negroes for a daily payment of a patacca. This manner of obtaining gold from a public mine is called, *minerar a talha aberta*."—*Von Spix*.

When this place was first discovered by the gold-hunters, it is said, that they had nothing more to do, than to pull up the tufts of grass or small plants on the side of the hill, and shake the precious dust from the roots. Mr. Luccock says, "The steep slope of the mountain is covered with a coarse kind of grass or rushes in small clumps or bunches; hence, when rain falls heavily, little rills pass round and between the roots, and whatever of a ponderous nature they hurry downwards, must be detained wherever their rapidity is checked. This happens at every tuft of rushes which stands directly in the little water-course; and hence these roots, I presume, have become rich in metal, and they had at that time been undisturbed for ages. Hence, those who pulled the grass would find the gold, and those who plucked a second crop, must as naturally be disappointed. As these streamlets descended the hill, collecting a greater quantity of water, they acquired more force, and formed for themselves, by tearing away the soil, a course with an irregular bottom, having hollows in the softer parts, which would exist in the form of basins, and the descending metal would be retained in them; hence the formation of these little *caldeirao*s which often suddenly enriched an adventurer. A great quantity of the precious metal has doubtless passed on

* Sometimes woollen cloths are used; and the first English blankets sold by Mr. Luccock at Rio, were employed in this way.

without impediment, and been collected in the lake below, or buried amid the wreck with which it has been filled, and must there remain until better methods of mining are adopted."

The colour of the gold found here, varies from the most beautiful gold-yellow, to a reddish copper-colour, a bright yellow, and even a grey yellow. There is a kind called *ouro branco* (white gold), which Mr. Luccock, however, supposes to be platina; *ouro preto* (black gold), which appears in the form of a dark-coloured dust; and what is called *ouro inficionado* (poisoned gold), which, though pure, is often pale or copper-coloured.

The iron foundry of Ypanema is situated in a beautiful valley at the foot of the wooded mountain of Guarassajava, which contains vast masses of magnetic iron ore. The foundry belongs to government. There are six or eight buildings for smelting and casting iron, besides a large house in which the director resides, and several smaller dwellings occupied by the workmen and their families, among whom are several Germans.

"The works stand near a small stream of water at a considerable distance from the locality of the mineral. At a great labour the ore is transported in its rough state from the mountain upon the backs of mules. The mineral is said to yield ninety per cent of pure metal, which, although of a fine quality, is asserted to be too brittle for economical use. Greenstone, which is found near, is thrown into the furnace in fragments, and renders the iron more ductile. The principal castings are wheels, cylinders, &c., for the *sugar engenhos* of the vicinity.

This is the only iron foundry in the empire. In 1810, the Portuguese government, then directed by the Count de Linhares, prime minister of Portugal, directed the working the iron of Ypanema, and where he sent for a company of Swedish miners to conduct the business. Little was accomplished until the Conde da Palma, who succeeded him, authorised more extensive works to be constructed. Subsequently, during the war of the revolution, little further was done. Dom Pedro I. did not restore the business; but under the regency of Feijó the old works were rescued from ruin, and they were enlarged with the design of entirely supplying Brazil with native iron. Major Bloem, at present the director, was sent to Europe to examine the manufacturing of iron in England. Where and on the continent, he visited sixty of the principal establishments, and returned with drawings and plans for the execution of his designs. He also engaged a large number of German artizans and labourers to carry on the works. On his return, before he had fairly commenced putting his plans into operation, the government funds were not forthcoming. The administration was changed, and the new ministers seemed jealous of the success of a measure originated under their predecessors. The German labourers, like Swiss soldiers, became discon-

tented, from being badly paid, and one after another absconded. Major Bloem however, at last succeeded so far, that in about two months about 8000 dollars' worth of iron was produced.

This iron foundry may, however, be considered a failure, and in a ministerial report for 1843, it was suggested, "*whether*, after thirty-four years of experiment, this whole establishment had not better be abandoned, at least until it could cease to prove a bill of expense to the imperial treasury."

Lead Mines.—These have been discovered at Cuyabara, west of Capão, and near Prula, a red lead ore, and a green chromate, has been here partially mined, and said to resemble those of Siberia.

Topaz Mines.—These are chiefly at *Capao*, or *Chapoam*. They are found in a quarry, where micaceous earth, ferruginous porcelain earth, and quartz seem to prevail, and out of which they are dug in a most obscure way by slaves, tracking for them. The greater portion of those dug up are said to be full of flaws.*

A gold mine has been worked near the same place, the ore or dust being chiefly found in quartz. Gold dust is found in many other parts of Minas Geraes, Matto Grosso, &c.

Diamond District.—The chief places for digging for diamonds are at the river Mandonga, the Rio Pardo, &c. The working for diamonds was seized upon as a monopoly by government, under the Junta Real par a Administração das Diamantes.

When visited by Mr. Mawe, he says,—

"Yet, notwithstanding the idleness of the inhabitants, Tejuco may be called flourishing, on account of the circulation of property created by the diamond works. The annual sum paid by government for the hire of negroes, salaries of officers, and various necessities, such as nitre and iron, does not amount to less than 35,000*l.*; and this, added to the demands of the inhabitants of the town and its vicinity, occasions a considerable trade. The shops are stocked with English cottons, baizes, and cloths, and other manufactured goods; also hams, cheese, butter, porter, and other articles of consumption. Mules from Bahia and Rio de Janeiro come loaded with them."

No idea was at first entertained, that the rivulets contained diamonds; they were considered curious bright stones, until a few of them found their way to

* Von Spix says, "The size of the stones is very various: the workmen affirmed that pieces have been found as large as a fist. The natural colour is manifold, sometimes greyish, sometimes bright yellow, and sometimes a mean between this and carnation of different shades, very rarely dark red. The stones which are found in the mala-cacheta are said to be the lightest. The inhabitants understand how to give to the topazes an artificial colour, particularly rose colour, by means of heat. The number of topazes annually found here is very considerable, but not always pure and fit for polishing; a great part of them are of so imperfect a colour and so full of flaws that they are thrown away as useless. The greater part of these topazes is exported from this place to Rio de Janeiro, a smaller portion to Bahia; and in both places so great a quantity has been accumulated within a few years, that the prices there are lower than at the mine itself. Together with the topaz, the euclase is also found here, and has attracted the attention of the Mineiros, since mineralogists have inquired after it. This stone in general is scarce, and is more frequent in the mine of Capã than that of Lana."

Lisbon, and were given as pebbles to the Dutch minister, to send to Holland; where the lapidaries pronounced those pebbles to be fine diamonds. This was made known to the Dutch consul at Lisbon, who managed to contract for the precious stones. Government afterwards endeavoured to monopolise the diamonds, and made the district of Sierro do Frio its centre of operations.

The number of diamonds sent to Portugal, during the first twenty years, was said to exceed 1000 ounces in weight.

Government was afterwards prevailed on to let the mines to a company, who were under certain stipulations to work with a limited number of negroes, or to pay a certain sum per day for every negro employed. This opened a door to fraud; yet the company continued in possession of the diamond mines until about the year 1772, when government retook possession of them.

From this time, the establishment was always in debt to foreigners, who had advanced money on the security of having all the diamonds which the mines produced. During a period of five years, from 1801 to 1806 inclusive, the expenses were 204,000*l.*; and the diamonds sent to the treasury at Rio de Janeiro, weighed 115,675 carats. The produce of the gold mines in the same period realised 17,300*l.* These years were esteemed singularly productive: for the mines have not in general yielded more than 20,000 carats annually. Extensive smuggling is, however, carried on in diamonds.*

Brazil comprises probably one of, if not, the richest regions of precious metals and gems in the world; but we are not prepared to conclude, that the emperor or the people will be rendered either powerful or prosperous from these mineral resources; no more than Peru or Mexico have been from their resources of gold and silver. The province of Minas Geraes† has, no doubt, become settled and opened in consequence.

In 1825, the Anglo-Brazilian Mining Company purchased the mines of Congo Soco for 70,000*l.* That company has certainly carried great enterprise to, and enriched, the district by an enormous expenditure. Mr. Kidder says, in 1844, its speculations were conducted with profit; but this we have heard denied. The operations of the company extend towards other districts, and the head-quarters were fixed in the town of San Jose, on the bank of the Rio das Montes; a place going to decay, until the establishment of the English company. One-fifth of the minerals exported by this company is exacted as a royalty by the government.

* As the greatest horror is expressed, in all polite companies in Tejuco, at the very mention of the word *grimpeiro* or smuggler, Mr. Mawe expected at first, that he should not see a diamond there except in the treasury. "But a little acquaintance with the town," he says, "soon convinced me that I was a novice; for, on visiting a few friends to whom I had introductions, I found that diamonds were bartered for every thing, and were actually much more current than specie. Even pious indulgences were bought with them; and surely, no one could have suspected that the seller of his holiness's bulls would condescend to taste the forbidden fruits of Tejuco."

† See brief description of Minas Geraes, Mina Novas, Goyaz, and Matto Grosso.

CHAPTER V.

POPULATION OF BRAZIL—SOCIAL CONDITION—EDUCATION—RELIGION—
GOVERNMENT.

THE population of Brazil is divided into free and slave inhabitants.

First.—The free inhabitants consist of, 1. Europeans; 2. White persons born in Brazil, who call themselves Brazilians; 3. Mulattoes, or the mixed caste between whites and blacks; 4. Mamalucoes, the mixed caste between whites and aborigines; 5. Aborigines in a domesticated state, generally called Cabocloes; 6. Indians in a savage state; 7. Free negroes born in Brazil; 8. Manumitted Africans; 9. Mestizoes, or zamboes, or between the mixed caste, aborigines and negroes.

Second.—The unfortunate slave population consists of Africans, creole negroes, mulattoes, and mestizoes. In Brazil there is little political division of castes; this has induced intermarriage with the natives. According to the old code, people of colour were not eligible to some offices of government, nor could they become members of the priesthood; but the mixed castes have gradually advanced, and the regulations against them have become almost obsolete.* Marriages between white men and women of colour are not rare, and scarcely observed, unless the woman is of very dark colour.† The mamalucoes reside mostly in the interior, they have more independence of character than the

* "A mulatto enters into holy orders," says Mr. Koster, "or is appointed a magistrate, his papers stating him to be a white man, but his appearance plainly denoting the contrary. In conversing on one occasion with a man of colour, who was in my service, I asked him if a certain capitam-mor was not a mulatto?" He answered, "He was, but is not now." I begged him to explain, when he added, "Can a capitam-mor be a mulatto?"

† Of the ciganoes, or the gipsies of Brazil, Mr. Koster says, "I frequently heard of these people, but never had an opportunity of seeing any of them. Parties of ciganoes were in the habit of appearing formerly once every year at the village of Pasmado and other places in that part of the country; but the late governor of the province was inimical to them, and attempts having been made to apprehend some of them, their visits were discontinued. They are represented as being a people of a brownish cast, with features which resemble those of white persons, and as being tall and handsome. They wander from place to place in parties of men, women, and children, exchanging, buying, and selling horses and gold and silver trinkets. The women travel on horseback, sitting between the panniers of the loaded horses, and the young ones are placed within the panniers among the baggage. The men are excellent horsemen, and although the packhorses may be overburdened, these fellows will only accommodate matters by riding slowly upon their own horses, and never think of dividing the loads more equally; but they preserve themselves and the animals upon which they ride, quite unincumbered. They are said to be unmindful of all religious observances, and never to hear mass or confess their sins. It is likewise said, that they never marry out of their own nation."

mulatto. They are much handsomer than the mulattoes, and the mamaluco women are considered superior in beauty to all others.

The creole negroes, in the northern districts, are brave and hardy, and willing to please the whites; but easily affronted, and the slightest allusion to their colour enrages them. They will sometimes reply: "A negro I am, but always upright." They have their own regiments, as well as the mulattoes, of which every officer and soldier of the former is perfectly black. The uniform is white cloth, turned up with scarlet. On gala days, the superior black officers, in their white uniforms, pay their respects to the government exactly in the same manner as officers of any other caste. Negroes have been excluded from the priesthood, and from the civil offices to which the mulatto is eligible.

Slaves.—The laws respecting slaves are considered by most travellers humane, and their treatment not severe. Aboriginal slavery has been legally abolished; mulattoes and all those of colour are slaves whose mothers are slaves of African origin; for no shade of the colour or blood of the *whites* entitles the child, whose mother is a slave, to freedom. Mr. Koster saw several persons, to all appearance of white origin, held in slavery. The Brazilian slave is taught the religion of his master. The numerous holidays of the Catholic calendar afford the slave thirty-five free days in the year, besides Sundays, to work for himself; and few masters venture to deprive their slaves of these periods. The slave can by law compel his master to manumit him on tendering the sum for which he was purchased, or for which he might be sold. Slaves are also often manumitted at the death of their masters, and persons of large property frequently set a few of them at liberty. A great number of infant slaves are also often declared free at their baptism, either by the sponsors, or in cases where the father is free: the master is obliged to manumit the infant at the baptismal font, on the price of a new-born child, about 5*l.*, being presented to him. Still slavery, with all its mitigation, is liable to horrible cruelty, and it is a bitter condition in any country. The slaves whose condition is the most degraded and miserable, are those employed in the mines, especially the diamond mines.

The Aboriginal Inhabitants consist of numerous tribes, many of whom are still asserted to be cannibals. We consider, however, that the latter charge is very much, if not altogether, an exaggeration. The Tapuyas, or Taperivas, were the most noted of the Brazilian tribes in the northern districts, and had extended themselves for a considerable way along the coast. The Topinambas had their chief settlements in Bahia. The Molopagues and Motayes had established themselves on the river Paraiba. The Botocudoes, or Aymares, were found in Minas Geraes and Porto Seguro: the Tamoyos, in Rio Janeiro; the Coroardoes, in Minas Geraes; the Guaycurues, in Matto Grosso; and the Puries, in Espiritu Santo.—(For further remarks on the aborigines, see Sketch of the Provinces.)

In many parts the old Portuguese costume, often very gaudy, continues to be worn ; but modern European fashions have been adopted in most of the towns. According to the last and best accounts which we possess, and as arranged by Mr. Kidder in his recent work on Brazil, and from the return of the consul at Pernambuco, in 1844, the population of the several provinces was divided as follows : viz.,

ESTIMATED Population of the Empire of Brazil in 1844.

PROVINCES.	Free Inhabitants.	Slave Population.	Whole Population.	PROVINCES.	Free Inhabitants.	Slave Population.	Whole Population.
	number.	number.	number.		number.	number.	number.
Rio Grando do Sul.....	160,000	Brought forward..	2,763,205
Santa Catharina.....	53,707	12,511	66,228	Sergipe.....	120,000
San Paulo.....	326,902	Alagoas.....	120,000
Rio de Janeiro*	196,926	239,557	436,483	Pernambuco*	600,920
City of Rio de Janeiro...	180,000	Parahiba.....	100,000
Minas Geraes.....	760,000	Rio Grande do Norte...	40,000
Goyaz.....	97,592	Ceara.....	180,000
Matto Grosso.....	40,000	Piahy.....	60,000
Espirito Santo.....	46,000	Maranhã*.....	105,119	111,905	217,024
Bahia.....	650,000	Para*.....	250,000
Carried forward....	2,763,205	Total.....	4,450,249

* Official statements. It is not considered by the consul that the slave population is included in the estimate for Pernambuco : and probably not fully in the other estimates which are left blank.

Nobility.—There are in Brazil eighty-eight titles of nobility, to wit: twenty marquises; twenty-nine viscounts; seven counts; and thirty-two barons. Titles of nobility are not hereditary. Sometimes the emperor concedes to a son the title of his father, when his services rendered to the country are considered of sufficient importance to merit such a favour.

Mr. Kidder dwells upon the want of an adequate population in Brazil, which is apparent, from the above statement. His remarks with respect to Irish emigration to that country are striking. He observes—

“ That one would naturally suppose that the Catholic Irish would prefer emigrating to a Catholic country, rather than to a land settled by Protestant pilgrims. Facts do not corroborate this supposition, but on the contrary, they indicate that the Catholic emigrant finds more toleration among Protestants, than he can even in a country professing his own faith. Various schemes, both private and public, have been set on foot to encourage emigration to Brazil, but they will all prove abortive until the principles of perfect toleration prevail in the country. I am aware that the constitution nominally tolerates all religions, and that very liberal feelings are cherished by enlightened and well-educated Brazilians generally. Nevertheless, the lower classes of the people, particularly the Portuguese and their immediate descendants, have a great amount of national prejudice and inherent bigotry to conquer before the position of foreign settlers among them would be at all pleasant.

“ Again, there seems to have been a preference hitherto given to the plan of settling foreigners in distinct communities, and not of encouraging them to intermingle with the inhabitants. That this plan is defective is manifest, from the circumstance that few or none of these colonies have prospered. Besides, nothing is more evidently lacking in all parts of Brazil than a sufficient number of practical, industrious mechanics. An accession to this class of inhabitants from almost any nation, would greatly elevate the condition of internal improvements, and advance the common interests of the country. The day is infinitely to be desired when Brazil shall be able to dispense with special exemptions, and what is worse, lotteries, as means of promoting the common arts of life.”

Education.—The instruction of youth has been lamentably neglected in Brazil.

Lately the French system has been introduced, in all its grades, from the primary schools to the law universities. Mr. Kidder observes—

“That a great degree of improvement upon the former state of things is already manifest, but at the same time the work of educational reform has only commenced. The government has adopted a liberal policy on this subject, but unhappily its measures are not in all respects the most judicious. To instance a single point, the schools are supported by direct annual appropriations from the funds of the several provinces, save those which fall under the supervision of the general government; to wit, the law universities and the schools of the capital. Hence there is a liability to fluctuation in the amounts appropriated. While at the same time, the people being constrained to bear the burden in the shape of an involuntary tax, have none of their sympathies enlisted in favour of the schools, and too often neglect to avail themselves of their advantages when established. In no instance is there a public fund to meet the expenses of education. How easy it would be, even now, to appropriate lands for this object, which, as they become settled and increased in value, would form a perpetual and ever enlarging source of income, sacredly devoted to the single purpose of education.

“It cannot be out of place to suggest to the Brazilians the very efficient system now in successful operation in the United States, as one well adapted to their circumstances, and capable of being made to promote their interests, beyond the possibility of calculation. In all the provinces it is complained that there is a great lack of competent teachers. This deficiency has every prospect of continuing until more liberal salaries are paid for their services, even though the normal schools should be more successful than they have hitherto been. Those young men who become qualified for the important task of instruction, will turn their attention to more lucrative employments.

“Another serious obstacle to the progress of education in Brazil, is the almost universal deficiency of suitable school books. Throughout some portions of the interior, children are taught to read from manuscripts. Printed matter is very rare, and generally very indifferent. A newspaper or a book that finds its way to the school, virtually becomes public property, and is passed from hand to hand as an acquisition from which all, by the common laws of humanity, are entitled to expect some benefit.

“In addition to what has already been mentioned, it is to be feared that education in Brazil meets with the most serious embarrassments in the spirit and habits of large portions of the people. They have not been trained up to appreciate the importance of mental cultivation. Their tastes have been formed after the model of other times. Their highest ambition of intellectual enjoyment is associated with the dull excitements of the festas. What is more degrading still, they are many of them under spiritual subjection to men who are jealous of improvement, and who resist efforts in its behalf as dreadful innovations.”

A priest residing in one of the largest cities of the empire, exercising his functions beneath the walls of one of the universities, was heard to say, “*Nao gosto de livros; gosto mais de jogar.*”—“I have no relish for books; I like gaming better.” A Brazilian statesman has said in the imperial legislature—

“As it respects the civilisation of the Brazilian people, properly speaking, almost nothing, unfortunately, has been done. A narrow strip on the coast is that which alone enjoys the benefits of civilisation, while in the interior our people are still to a great degree enveloped in the greatest barbarism. We have been unable to do any thing, and nothing can be accomplished without the aid of a moral and intelligent clergy.”

The cause of education in Brazil is not however altogether hopeless; there are schools, and the press is at work. Mr. Kidder observes—

“The history of Brazilian literature is brief; yet under the circumstances in which it has sprung up, that literature must be considered creditable. Of all that has been written in the Portuguese language within the last hundred years, Brazil has produced

her full proportion of what is meritorious. The names of Caldas and Magalhaens, in the department of poetry; Moraes in philology; and the Andradas in science and philosophy. Within the last few years there has been a decided and promising movement at the capital in behalf of literature and the diffusion of useful knowledge. Several institutions have sprung up which, it is hoped, will exert a salutary and an extensive influence.

"It must, perhaps, be considered as a misfortune to Brazil in a literary point of view, that her language is the Portuguese. A prejudice against that language prevails extensively among foreign nations. Although that prejudice is in a great degree unjust, yet it will not soon be overcome. Hitherto the meagerness of Portuguese literature, if it has not originated the sentiment alluded to, has at least strengthened it."

Brazilians are, in general, a temperate people. Although the use of wine is common among them, wherever it can be procured—and although cachassa, one of the worst species of alcoholic drinks, is almost as common as water—yet public drunkenness is rarely witnessed, unless it be among foreign sailors who visit the ports.

Religion.—On few subjects do Brazilian writers, of all classes, express themselves with greater unanimity of opinion than respecting the state of religion in the country. People and ecclesiastics, officers of state, men of business, and politicians, all agree in representing the condition and prospects of religion as unsatisfactory.

Monasticism is on the decline—the number of secular priests is diminishing—the churches are falling into ruin, and the spirit and principles of infidelity are already disseminated far and wide! All this in a country peopled by the descendants of the inquisitors, and in which, from the period of its discovery, Roman Catholicism has held an undisputed predominance.—*Kidder.*

The following statements appear in the report of the minister of justice and ecclesiastical affairs, addressed to the imperial legislature of 1843:

"The state of retrogression into which our clergy are falling is notorious. The necessity of adopting measures to remedy such an evil is also evident. On the 9th of September, 1842, the government addressed inquiries on this subject to the bishops and capitular vicars. Although complete answers have not been received from all of them, yet the following particulars are certified.

"The lack of priests who will dedicate themselves to the cure of souls, or who even offer themselves as candidates, is surprising. In the province of Pará there are parishes which, for twelve years and upwards, have had no pastor. The district of the River Negro, containing some fourteen settlements, has but one priest; while that of the River Solimoens is in similar circumstances. In the three comarcas of Belem, the Upper and the Lower Amazon, there are thirty-six vacant parishes. In Maranham twenty-five churches have, at different times, been advertised as open for applications, without securing the offer of a single candidate.

"The Bishop of San Paulo affirms the same thing respecting vacant churches in his diocese, and it is no uncommon experience elsewhere. In the diocese of Cuyaba, not a single church is provided with a settled curate, and those priests who officiate as stated supplies, treat the bishop's efforts to instruct and improve them with great indifference.

"In the bishopric of Rio de Janeiro, most of the churches are supplied with pastors, but a great number of them only temporarily. This diocese embraces four provinces, but during nine years past not more than five or six priests have been ordained per year.

"It may be observed, that the numerical ratio of those priests who die, or become incompetent through age and infirmity, is two to one of those who receive ordination. Even among those who are ordained, few devote themselves to the pastoral work. They either turn their attention to secular pursuits, as a means of securing greater conveniences, emoluments, and *respect*, or they look out for chaplaincies, and other situations, which offer equal or superior inducements, without subjecting them to the *literary tests*, the trouble and the expense necessary to secure an ecclesiastical benefice.

"This is not the place to investigate the causes of such a state of things, but certain it is, that no persons of standing devote their sons to the priesthood. Most of those who seek the sacred office are indigent persons who, by their poverty, are often prevented from pursuing the requisite studies. Without doubt a principal reason why so few devote themselves to ecclesiastical pursuits, is to be found in the small income allowed them. Moreover, the perquisites established as the remuneration of certain clerical services, have resumed the voluntary character which they had in primitive times, and the priest who attempts to coerce his parishioners into the payment of them almost always renders himself odious, and gets little or nothing for his trouble."

By a royal decree of 1752, all the tithes of the Portuguese ultra-marine possessions were secularised, being made payable to the state, while the state became responsible for the support of the clergy.

The arrangement proved profitable and convenient to the crown. The government put the priests on short allowance, and fixed their salaries at fifty, eighty, and one hundred milreis—sums which have been lessening ever since, by a depreciation of the currency. Efforts have been made in Brazil, since the era of independence, to raise the stipend of the clergy, and they have been nominally successful, although the present salary of two hundred milreis (about five pounds sterling) is scarcely more valuable than the sum of one hundred formerly was.

That the scanty emoluments of the clergy have had the effect to lessen the number of incumbents, there can be no doubt; but that they have, on the whole, been productive of injury in any form, is not so evident, since, as the Archbishop of Bahia once remarked, "It is better to have no priests than to have those who are ignorant and immoral."

Ignorance and superstition, no doubt, prevail very generally in most parts of Brazil. The religious belief is, nevertheless, Catholic, although an error has been entertained that the Sebastianists* are still a prevailing sect. This opinion is altogether untrue, although some of that mad sect still exist.

* The Sebastianists are those who believe in the re-appearance of Dom Sebastian, King of Portugal, who made an expedition against the Moors in Africa, in which he was defeated, and though never heard of, was probably killed in that battle. The prime point of faith is, that he will yet come, and that, too, as each believer has it, in his own lifetime. The Portuguese looked for his appearance at Lisbon, but the Brazilians generally think that he will most likely first revisit his own city of Sebastian.

An abominable villain, named Joao Antonio, fixed upon a remote part of the province of Pernambuco, near Piancó, in the Comarca de Flores, for the appearance of the said Dom Sebastian. The place designated was a dense forest, near which were known to be two acroceraunian caverns. This spot the impostor said was an enchanted kingdom, which was about to be disenchanted, whereupon Dom Sebastian would immediately appear at the head of a great army, with glory, and with power to confer wealth and happiness upon all who should anticipate his coming by associating themselves with the said Joao Antonio.

He found followers, who, after awhile, learned that the imaginary kingdom was to be disenchanted by having its soil sprinkled with the blood of one hundred innocent children! In default

CHAPTER VI.

CONSTITUTION, GOVERNMENT, ARMY, AND NAVY.

IN the year 1825, and on the 11th of December, Dom Pedro swore to a constitutional form of government, by this compact it was provided, that the empire of Brazil is "a political association of all Brazilian citizens: which make a free and independent nation, which admits of no link of union or federation which would oppose its independence:" further that,—

Its territory is divided into provinces, which can be subdivided according as the good of the state shall require it.

Its government is monarchical, hereditary, constitutional, and representative.

The reigning dynasty is declared to be that of Dom Pedro I., emperor and perpetual defender of Brazil.

The Catholic, apostolic, and Roman religion is to continue to be the religion of the empire. Every other religion will be permitted, with the exercise of its domestic or particular faith, in houses for this purpose, but without any exterior form of the temple.

The second section determines who are to be considered Brazilian citizens. It declares that foreigners may be naturalised as citizens of Brazil, without reference to their religion.

Section third determines the powers of the national representatives, and divides the judicial powers into four sections, legislative, controlling, executive, and federal. The emperor and the general assembly are declared the representatives of the nation.

of a sufficient number of children, men and women were to be immolated, but in a few days they would all rise again, and become possessed of the riches of the world. The prophet lacked the courage necessary to carry out his bloody scheme, but delegated power to an accomplice, Joao Ferreira, who assumed the title of "His Holiness," put a wreath of rushes upon his head, and required the proselytes to kiss his toe, on pain of instant death. After other deeds too horrible to describe, he commenced the slaughter of human beings. Each parent was required to bring forward one or two of his children to be offered. In vain did the babes shriek, and beg that they might not be murdered. The unnatural parents would reply, "No, my child, there is no remedy," and forcibly offer them. In the course of two days he had thus slain twenty-one adults and twenty children, when a brother of the prophet, becoming jealous of "His Holiness," thrust him through, and assumed his power. At this juncture some one ran away, and apprised the civil authorities of the dreadful tragedy.

Troops were called out, who hastened to the spot, but the infatuated Sebastianists had been taught not to fear any thing, but that should an attack be made upon them, it would be the signal for the restoration of the kingdom, the resurrection of their dead, and the destruction of their enemies. Wherefore on seeing the troops approach, they rushed upon them, uttering cries of defiance, attacking those who had come to their rescue, and actually killing five, and wounding others, before they could be restrained. Nor did they submit until twenty-nine of their number, including three women, had actually been killed. Women, seeing their husbands dying at their feet, would not attempt to escape, but shouted, "The time is come," &c.

The legislative power is delegated to a general assembly with the sanction of the emperor. The general assembly is composed of two houses, a chamber of deputies, and chamber of senators, or senate.

The attributes of the general assembly are—1. To administer the oath to the emperor, the imperial prince, to the regent or regency.

2. To elect the regency or regent, and to put the limits of its authority thereon.

3. To recognise the imperial prince as successor to the throne in the first session which follows his birth.

4. To name the tutor of the minor emperor in case his father should not have named him in his testament.

5. To clear the doubts which may be entertained relative to the succession to the crown.

6. To institute at the time of the emperor's death, or at the vacancy of the throne, an inquiry into the administration finished, to reform the abuses which may have intruded.

7. To choose a new dynasty in case of the extinction of the regent dynasty.

8. To make laws, to interpret them, to suspend the same, or revoke them.

9. To watch over the maintenance of the constitution, and over the general good of the nation.

10. To fix annually the public expenses, and to make the assessment of the direct taxes.

11. To fix annually, according to the government, the sea and land forces, ordinary and extraordinary.

12. To accord or oppose the entrance of foreign forces, by land or by sea, into the interior of the empire, or into its ports.

13. To authorise the government to contract loans.

14. To establish convenient measures for the payment of the public debt.

15. To rule the administration of the national domains, and to decree the alienation of them.

16. To create or suppress the public offices, and to fix their rules.

17. To determine the weight, the name, the value, the inscription, the type, and the denomination of the moneys, as well as the standard of the weights and measures.

Each chamber to bear the appellation of august and noble representatives of the nations.

Each legislature will last four years, and each annual session four months.

The opening of the imperial sitting will take place every year on the 3rd of May. The closing of the assembly, will also be an imperial assembly, and these two assemblies will take place at a general assembly, with the meeting of both chambers.

The naming of presidents, vice-presidents, and secretaries of both chambers, the verification of the powers of its members, the oath to be taken, and the police of the interior, to be settled under the form of an internal rule.

All questions on a division shall be decided by the majority of the members present.

The members of each chamber shall be held inviolate for their opinions, given in the exercise of their functions.

No senator or deputy can be arrested during his deputation, by any authority except by order of his chamber, or unless being taken in the fact of committing a capital crime.

The senators and deputies may be elected ministers and councillors of state, with the difference that the senators may continue to sit at the senate, and that the deputies will on taking office leave their seat vacant, and must proceed to a new election, in which he may be re-elected, and then assume his functions.

The chamber of deputies is elective and temporary.

To the chamber of deputies belongs the initiation,—1. Of the taxes; 2. Of the recruiting service; 3. Of the choice of a new dynasty in case of the extinction of the old one.

In the chamber of deputies shall be initiated,—1. The examination of the former administration, and the reformation of its defects; 2. The discussion of the propositions made by the executive power.

The chamber of deputies alone is to decide whether there be any cause to accuse the ministers and councillors of state.

The deputies shall receive, during the session, a remuneration to be fixed at the end of the last session of the preceding assembly.

The senate is composed of members for life, and organised by provincial elections.

Each province shall furnish as many senators as deputies, and when the number of deputies is uneven, the number of its senators shall be the half of the inferior even number, so that the province which has eleven deputies shall have five senators.

The province which has but one deputy shall always elect a senator, notwithstanding the above-mentioned rule.

The elections shall be made in the same manner as those of the deputies, but with *treble lists*, from which the emperor shall choose one-third.

The qualifications for a senator must be,—1. Born a Brazilian citizen, and to enjoy one's political rights; 2. Aged forty, at least; 3. Learned, able, and virtuous: those would be preferred who have rendered some service to their country; 4. In the possession of a revenue of 800 milreis yearly, either in property, or through industry, commerce, or employments.

The princes of the imperial house are of right senators, and will take their place in the senate at the age of twenty-five.

The exclusive attributes of the senate are,—

1. To take notice of the individual faults committed by the members of the imperial family, the ministers of state, the councillors of state, the senators, and by the deputies during the period of their legislation.

2. To watch over the responsibility of the ministers and councillors of state.

3. To expedite letters of convocation of the assembly, in case the emperor should not have done it two months after the time fixed by the constitution, the senate shall reunite extraordinarily to this effect.

4. To call together the assembly at the time of the emperor's death for the election of a regent, in case it should so happen that the provisional regent has not accomplished it.

The proposition, opposition, and approbation of projects of law belong to both chambers.

The executive power exercises, through each of the ministers of state, the power of proposal which belongs to him in the formation of the laws. It is only after having been examined by a commission of the Chamber of Deputies, from whence it must have its origin, that it can be converted into a law project.

If the emperor refuse his consent to a law passed by the assembly, he will answer as follows :—"The emperor will meditate on the project, and resolve at the convenient time." To which the chamber shall reply, that it praises his majesty for the interest he takes in the nation, but if two successive legislatures approve of the project, and present it successively in the same terms, it is understood that the emperor will give his sanction.

The fifth chapter of the constitution appointing general councils of the provinces, has been revoked in 1834, and annual representative assemblies elected every two years for each province.

The constitution then at great length defines the powers of the emperor. His person is sacred,—he convokes, prorogues, and dissolves the general assembly,—sanctions or disallows its decrees,—appoints and displaces his ministers,—remits or mitigates punishments,—appoints and suspends magistrates,—proclaims amnesties, appoints bishops, and provides for ecclesiastical benefices,—names and provides for civil employments,—appoints the military and naval commanders and officers,—sends his ambassadors and ministers to foreign courts, and intrusts them with the direction of negotiations,—forms treaties of alliance, offence, defence, subsidy, and commerce,—but submits them afterwards to the general assembly for approval,—declares war and makes peace,—grants letters of naturalisation,—confers titles and honours, civil and military,—publishes the decrees for executing the laws, &c. &c.

The constitution also provides an imperial council of state for life, but

not to exceed ten in number. The organisation of the army and navy is then provided for; judges and courts of law are also organised. The independence of the judges is declared as follows:—The legal power is independent, and will be composed of judges and juries, who will be employed for civil as well as criminal law.

The juries will pronounce on the case, and the judges will apply the law. Judges by right will be perpetual, but this does not mean that they cannot be removed from one place to another, during the time and manner explained by the law. The emperor can suspend them for complaints made against them, after always having heard the judges themselves, and taken the necessary informations, and heard the council of state. The judges cannot lose their places but by a judgment.

All judges of a district, and the officers of justice, are responsible for abuses of power, and for prevarications which they may commit in the exercise of their offices, and may be prosecuted for bribery, corruption, extortion, and embezzlement of public money. The action may be followed up by the plaintiff himself for one year and a day, or any other individual of the municipality, according to the legal order of prosecution.

In the provinces of the empire, tribunals of the second and highest order, for the convenience of the citizens, shall be instituted.

In criminal cases the interrogatives of the witnesses will be published, and all the other acts of the prosecution will be published after judgment.

In civil and penal cases, carried over to the civil tribunal, the parties may name arbitrators.

One cannot commence a prosecution without proving one has used means of reconciliation.

For this purpose there will be judges of peace, who will be elected in the same manner and for the same time as the officers of the chambers.

In the capital of the empire, besides the tribunals which ought to exist as in the other provinces, there will be another tribunal under the denomination of *tribunal of justice*, the members of which will be chosen from the other tribunals, with the title of councillors. This tribunal shall accord or refuse the review of cases, recognise the faults committed by its officers, by those of the other tribunals, by those employed by the diplomatic body, and by the presidents of the provinces, and take cognisance and decide in all contentions of jurisdiction, and the competition of the tribunals of the provinces.

There will be a president named by the emperor in each province, who may change him according to the good of the service.

The National Treasury.—The receipts and expenses of the national finances will be confided to a tribunal under the name of the national treasury, which, in its different divisions established by the law, will have the administration and re-

sponsibility in reciprocal correspondence with the treasuries and authorities of the provinces of the empire.

All direct contributions, with the exception of those which are applied to the sinking of the public debt, will be annually voted by the national assembly, but they will continue to be gathered until their abolition has been pronounced, or until they have been replaced by others.

The minister of finances, after having received from the other ministers the lists relative to the expenditures of their ministry, will present annually to the chamber of deputies, as soon as it assembles, a general balance of the receipts and of the expenditure of the national treasury of the preceding year, as well as the general list of all the public expenses of the future year, and the value of all the contributions and all the public revenues.

CIVIL AND POLITICAL RIGHTS AND OBLIGATIONS OF CITIZENS.

1. No citizen under any compulsion, except in accordance with the law.
2. No law shall be established without its having some public use.
3. No law will have a *retroactive effect*.
4. Every man may communicate his thoughts by words, writing, and publish them by means of the press, without fearing reproach ; every one will be responsible for the abuses they may commit in the exercise of this right, in the cases and under the form determined on by the law.
5. No person may be persecuted for any matter of religion, if he respect the religion of the state, and offend not the public morals.
6. It is permitted to every one to remain or depart from the empire as he thinks proper, taking with him his goods, in conforming to the rules of the police, and without bearing any malice to anybody.
7. The house of every citizen is an inviolable dwelling ; nobody may enter it at night, whoever he may be, without his consent, except in order to save it from fire or inundation.
8. Nobody can be arrested, save in case of a beginning of an accusation except in the cases foreseen by the law ; twenty-four hours after his imprisonment (if in a city, town, or village, in the neighbourhood of the residence of the judge, and in an interval in proportion to the extent of the territory, and determined by the law for the distant places), the judge will make known to the accused by letter, signed by his own hand, the reason of his imprisonment, the names of the accusers, and those of the witnesses, if there are any.
9. Even in the case of accusation, nobody can be conducted to prison, or be retained therein, if he gives a caution determined by the law ; generally for every crime that is not punished, with more than six months' imprisonment, or expul-

sion from the district in which the accused lives. The accused will remain at liberty.

10. Except when taken in the fact, the imprisonment cannot be executed without a written order from the acting authority; if this order is arbitrary, the judge who issued it, and he that received it, will be punished as determined by the law; in this measure regarding the imprisonment, are not comprehended military commands, necessary for solid bases of justice and equity.

From the present day whipping is abolished, as well as the torture, marking with red-hot iron, and every other barbarous punishment.

Penalties will alone be supported by the criminal; therefore, there cannot exist any confiscation of property, and never will the infamy of the criminal be transmitted to his relations, in whatever degree that may be.

The prisons will be secure, clean, and well attended; there will be different prisons to separate the criminals according to their situation and the nature of their crimes.

22. The right of property is guaranteed in all its fullness, if, after thorough examination, the public good requires that one should make use of the property of a citizen, he will be indemnified for the time to the amount of its value; the law will fix the cases in which this single exception will take place, and it will give the rules for the determination of the indemnity.

23. The public debt is equally guaranteed.

24. No manner of labour, of culture, of industry, or commerce, can be hindered any time that it does not oppose itself to the public morals or security and health of the citizens.

25. The corporations, with their deans, masterships, and secretaryships, are abolished.

26. Inventors will have the property of their discoveries, and of their productions; the law will give them an exclusive temporary privilege, or will recompense them, and will have regard for the loss they may sustain in the publication of the discovery.

27. The secrecy of letters is inviolable. The administration of the posts is rigorously responsible for the infraction of this article.

28. All recompenses conferred for services rendered to the state, either civil or military, are guaranteed, as well as the right acquired from these recompenses, conforming to the laws.

29. Persons in public employment are strictly responsible for abuses and omissions which they may commit in the exercise of their functions, and their negligence in surveying the responsibility of their subalterns.

30. Every citizen can present to the legislative and executive powers his reclamations, complaints, or petitions, and even expose all infractions to the consti-

tution, in reclaiming from the acting authority, the effective responsibility of the criminals.

31. The constitution guarantees public aid to the indigent.

32. Primary instruction is voluntary for all citizens.

33. The establishment of colleges and universities, in which will be instructed the elements of the sciences, arts, and literature, is hereby ordained.

34. The constitutional powers cannot suspend the constitution, in that which concerns individual rights, except in the cases and circumstances specified in the following article.

In speaking of the tribunals of Brazil, Captain Wilkes accuses the judges, magistrates, and other officers, of great partiality and injustice.*

CHAPTER VII.

POLITICAL DIVISIONS, OR PROVINCES OF THE EMPIRE.

UNDER the head of Population, we have given the names and population of the several provinces. To these are added the wilderness regions of GUIANA, north of the Amazon, and of SOLIEMOENS, a vast territory, ill explored, west of the Rio Madera, and south of the Amazon, extending to the limits of Brazil, or to the Rio Yavari. SOLIEMOENS is intersected by large rivers, and this extensive, naturally fertile, but wilderness region is inhabited by numerous aboriginal

* Captain Wilkes says, "The administration of justice is confided to two high tribunals, which are open to the public, and where causes are decided on appeal by a majority of the judges.

"These tribunals are, first, the *relação*, of which there are two branches, one at Rio and the other at Bahia, each composed of eight judges. Second, the supreme tribunal of justice of twelve judges. The inferior courts are those for the trial of civil and criminal cases, an orphans' court, and a court and judge of findings and losings, the last of which is not yet abolished, however obsolete it may have become. Great corruption exists in them all, and no class of people are so unpopular as the judges. It is generally believed, and the belief is acted upon, that to obtain justice, all classes, including priests and laymen, lawyer and client, legislators and people, regents and ministers, must submit to great imposition; that it is next to impossible to recover a debt by law except through bribery. If a debtor has money or patronage, and refuses to pay, it is difficult to obtain the payment even of an acknowledged note of hand through the process of the law, and it generally takes years to accomplish.

"It is, however, greatly to the praise of the Brazilians, that it is not often necessary to have recourse to law for this purpose. The greatest injustice occurs in the orphans' court: but the court of findings and losings is one of the most singular in this respect. It takes charge of all things lost and found, making it the duty of a person finding any thing to deposit it with the judge. The loser, to prove property, must have three witnesses to swear that they saw him lose it, and three others that they saw the finder pick it up, otherwise it remains as a deposit.

"The justices of the peace for each district are elected by the people, four at a time, to serve as many years by turns, substituting one for the other, when sickness or other circumstances prevent either from serving. They have final judgments in amounts not exceeding sixteen milreis. In cases of civil process, they act as mediators to effect a compromise and reconcile difficulties. Their political attributes are to preserve the peace in case of riot or disorder among the people; and they have a right to call on the national guard or military police to aid them, who must act under their direction. There is no civil police, and no imprisonment for debt."

tribes, speaking different tongues or idioms. Soliemoens contains several *povoacoes* (settlements), but in reality little more than a few rudely constructed buildings for the missions founded by the Carmelites along the banks of the Amazon. The *prezidio* de San Francisco Xavier de Tabatinga,* situated at the mouth of the Yavari, is estimated to be, by the voyageurs or canoemen, distant from the city of Para 2100 miles. The voyage upwards occupies from eighty to ninety days. A nation of aborigines, called *Soriman*, corrupted into *Solimáo* and *Soliemoens*, imparts a name to this province which is more thinly inhabited than any portion of Brazil. Its natural advantages of soil, climate, and river navigation, are, from all accounts, at least equal to those of any of the Mississippi regions. But a race of equal enterprize and industry with those which have peopled and cultivated and built cities in the latter, have not yet appeared on the waters, or amid the forests and plains of the former.

The REGION OF SPANISH GUIANA includes the whole of the Portuguese possessions north of the Amazon, west of the River Yamunda. This region extends about 900 miles from east to west, and from about 4 deg. north to 4 deg. south latitude. The western part forms the *ouvidoria* of the Rio Negro. This great river has its source in the Andes, and communicates by one of its branches, the Cassiquiari, with the Oronoco, and after flowing down upwards of 1100 miles, falls into the Amazon in latitude 3 deg. 16 min. south. A few leagues below the mouth of the Cassiquiari (from Para a voyage of eighty-six days going up) is, or was some time ago, the *fort* of San Joze dos Marabytaunas, then the remotest military station in this captaincy, situated on the left bank of the Rio Negro. Some other small posts were stationed between this and the Oronoco. Below San Joze there are straggling settlements of baptised Indians on each side of the river; and a few Portuguese adventurers, mixed races, and priests, appear here and there on the banks, and waters of the river down to its confluence with the Amazon. The Rio Branco is the largest tributary that enters the Rio Negro. It rises in the Sierra Baracayna from the northern slopes of which the Paragua, one of the great confluent of the Oronoco, flows.

Three leagues above the mouth of the Rio Negro is the town of Rio Negro (formerly the *fortaleza da Barra*), the entrepot for all the exports of the river, and the seat of government. According to the last accounts, it still contains a church, also a pottery, a rude cotton manufactory, and a rope-walk of the *piassaba palm*; all government works. At its mouth, the Rio Negro is about a mile wide, higher up it expands in some places to the width of seven and eight leagues. "Near the shore, the water appears the colour of amber; everywhere else, it is described as literally seeming black as ink; it is, however, perfectly clear, pure, and wholesome. The confluence is said to be a most

* Tabatinga is a fine white clay, much used in many parts of Brazil for buildings.

impressive spectacle ; but the turbid stream of the Amazon predominates, and the Black River loses its purity as well as its name. It is with the greatest delight that boatmen ascending from Para, or descending from the province of the Solimões, come in sight of the high lands at the bar ; for this river is free from all the physical plagues with which the Orellana is afflicted ; no torment of insects is felt there, no evils of local and endemic disease. When the Indians, therefore, escaping from both, first dip their oars into the clear dark waters, they set up a shout of joy, and enter with the sound of their rude music upon its happier navigation."

The YAPURA (or the Grande Caqueta), is one of the greatest rivers that flow into the Amazon. Its current is so rapid and mighty, that no boat could make way against it, were it not broken by innumerable islands. The scenery on its banks is described as magnificently romantic and beautiful, but the country is unhealthy. It communicates by lakes and streams with the Rio Negro.

The northern limits of Portuguese Guiana have been the subject of much dispute. By the treaty of Utrecht the river Oayapoek, Wiapoc, or Vincent Pinzon, was named as the common limit between Portuguese and French Guiana ; and the fort of St. Louis, situated on its northern margin, was the most southern establishment of what was called Equinoctial France. By the treaty of Amiens, the Aguary (or Arawary) was made the limit ; the line of demarcation being drawn from its source westward to the Branco, and the navigation was to be common to both nations. But by the treaty of 1817, Cayenne, which had been taken possession of by the Portuguese in 1809, was restored to France, and the Wiapoc was again made the boundary. Southey observes—

"To prevent all further cavil, its mouth was stated to be between the fourth and fifth degrees of north latitude, and in longitude 322 deg. east of the Island of Ferro. From thence, the line of demarcation was to be in conformity to the treaty of Utrecht."*

Where French Guiana terminates towards the west, the Brazilian territory borders on Columbia. The equinoctial line was their original boundary ; but the settlements on the Rio Negro, or rather, Portuguese encampments, have extended as high as the fourth parallel of north latitude.

The resources, such as great rivers, harbours, fertile soils, and valuable woods and fisheries, of Portuguese Guiana, are more than ample for the population and power of a great empire. Yet, at the present day, this vast region may be considered absolutely a wilderness, and, as far as the maintenance of the human race is concerned, scarcely superior to one great waste.

PROVINCE OF PARA.—Cazal divides the province of Para into four large districts : *Para Proper* is a flat and wooded country, extending west of Maranhão 200 miles to the River Tocantines ; *Xinguatania*, lying between the Tocantines

* Southey, vol. iii., p. 691.

and the Xingu ; *Tapajnoia*, extending from the latter river to the Tapajos ; and *Mundrucania*, so denominated from the Mundrucu Indians who inhabit it, extending from the Tapajos to the Madera. Of these divisions, the last three are, with the exception of a few settlements or encampments, on the margins of the rivers, almost wholly in the possession of the aboriginal tribes.

The more proper boundaries of this immense country, is limited by the River Ayapoek, French, Dutch, and British Guiana, on the north of the Amazon, and by the Rivers Yamunda and Madera on the west, following the Madera south of the Amazon to the Falls of St. Antony, in latitude 8 deg. 50 min. south. A recent writer, a citizen of Para,* includes in the province of Para the whole region west to the Yavari, in 70 deg. west, or the country called the Province of Soliemons, with the exception that the latter region, and the greater part of Para is still uninhabited, except by nomade tribes. The authority of Para, it is true, is as much extended over these wild lands as any other under the Brazilian government. Our recent information respecting Para is based on the work of Monteiro Baena, Mr. Kidder's work, the most recent, and the British and French consular reports.

"This immense extent of land," says Baena, "is agreeable to live in, fertile, covered by a luxuriant vegetation, which is gifted with many rare varieties, and by majestic forests composed of splendid trees, and proper for domestic or naval uses. It contains extensive lakes, towering mountains, and vast valleys ; the number of large rivers it encloses is astonishing."

The land is almost, without exception, of the most fertile description, and particularly so in the neighbourhood of the rivers and on their numerous islands, where the soil consists of successive alluvial deposits from four to eight feet deep.

Population.—The earliest tables of the population of the province are those of 1749, which then gave to the city of Para 900 hearths and 6579 inhabitants. After these we have only tables for the following years, viz.:—1788, 1083 hearths (families) and 10,600 souls; 1801, 1820 hearths and 11,500 souls; 1825, 1930 hearths and 13,240 souls ; 1830, 1740 hearths and 12,467 souls.

"The increase up to 1825 was not inconsiderable, when we consider that during that period it was repeatedly the seat of serious disturbances, and suffered four calamitous visitations of the small-pox and measles, which at each period carried off *one-third* of the whole population ; nor would we have to note a decrease of 180 hearths and 780 souls in the last census, compared to the previous one, were it not for our declaration of independence and the subsequent war with Portugal and the persecution and emigration of the Portuguese which

* "Corographical Essay" on the Province of Para, by Antonio Ladislau Monteiro Baena, a native of Para, Engineer and Professor of the Military School in Belem of Para, and Member of the Historical and Geographical Institution of Rio de Janeiro. Published at Para in November, 1839.

followed it. Further causes of decreased population were:—1. The avidity which, after our independence, the young men sought public employment, neglecting agriculture; 2. The quackery and ignorance of a number of men pretending to have a knowledge of medicine, the ignorance of midwives; and 3. The little resort to lawful matrimony, and the spreading habit of celibacy, or rather of concubinage.”

“Many circumstances render it difficult to obtain an exact census of the population, particularly the pressing of men for the military or naval service; and the ignorance and remissness of the clergy and other minor authorities.

The population of the province is composed of seven castes, viz.:—The whites, blacks, aborigines, mulattoes, Mamalucoes, *Curibocas*, and *Cafuzes*.

These distinctions are owing to the *whites* intermixing with the negro race and with the aborigines, and the cohabiting of the aborigines and African race. The Mamalucoes are the offspring of the whites and the aborigines; the mulattoes and the negro women are the parents of the *Cafuzes*; and the aborigines and the negro women produce the *Curibocas*, or *Sambos*.

Of these castes the whites are the fewest in number, and the aborigines the most numerous; besides these there are numerous tribes of wandering natives, whose numbers are unknown, who roam in the forests, and live amongst the most fertile parts bordering on the numerous rivers. Signor Baena enumerates the names of 157 Indian tribes, some of which live in small villages, and trade with the Brazilians or Spaniards within the Brazilian territory.

He considers that the natural disposition of most of these tribes is such that their assimilation to social pursuits would be easily effected, and that they would then become as useful as other tribes, “such as the Minas, Mundurucas, Jurcinas, and Parapuras, who bring drugs from the forests, assist in curing and salting fish, in extracting oil or butter from the eggs, and navigate or paddle the trading canoes on the rivers.”

With regard to the aborigines established in villages, he says, “their number has rapidly declined; in 1720 there existed 54,216, living in seventy-three missions, nineteen of which were established by the Jesuits, nine by the monks of St. Anthony, ten by the Capuchins, fifteen by the Carmelites, and ten by the mendicant friars. In 1839 their number was reduced to 32,751 living in villages, and none of the above orders of fathers or friars exist among them.

“Near the capital of Para there existed in 1720, domesticated natives 12,680; in 1800 they were reduced to about 5000, of which more than 2000 were occupied in cutting timber, and in transporting and loading it, in the construction of vessels, in throwing up works of defence for the city, and on board of armed vessels. In 1839 the number was reduced to 3500. The barbarous persecution

in the continued wars against the other aborigines, and the almost universal bad treatment of those poor people (which for so many reasons deserve our sympathy, and should even from self-interest have been differently treated, for they have undeniably given much manual labour to our predecessors), caused, with the devastations of the small-pox, this retrograde march of the Indian settlements all over the province, wherefore now most of the domesticated Indian villages are insignificant."

Climate.—Baena says,—“There is no particularly sensible difference in the climate of this province all the year round, yet there is a particular time for the production of fruits. The more lasting rains begin regularly in December or January, and last till June or July. On the upper part of the River Solimoes they begin only in May. At that time some intermittent fevers (Tertian and Quartan) make their appearance, by which the forest Indians suffer much, because they have no means of curing or nursing themselves, and, like all savages when falling ill, become immediately pusillanimous. At that time the rivers also swell and rise above their ordinary banks, and in some, particularly the Amazon and Madera, the voyages upward become very troublesome, because of the great currents which the barges and canoes must overcome by being drawn by ropes from the banks; towards the evening very severe storms are frequent, and almost of daily occurrence on those rivers, and often as dangerous to small craft as the above-named.

“The verdure of the trees is uninterrupted all the year round, and about October or November only the pasturage gets sometimes dried up on the more elevated points, because August, September, October, and November, are the least rainy months.

“The morning air is particularly delicious. As the afternoon approaches a pleasing coolness comes on, and the nights are generally sufficiently cool, and the climate does decidedly not possess that high degree of temperature which the tropical situation of the country would authorise us to expect.

“The innumerable rivers, bays, and lakes, the prevailing north-west and east trade winds, and the extensive forests refresh the air in a wonderful manner. In 1839, among twenty-seven parishes there were existing thirty-six men and thirty women above ninety years old, amongst which were eleven white men and seven white women, and there is credible proof of an Indian woman having reached the age of 200 years.”

Natural Productions of the Province of Para.—Our author, in his account of the indigenous productions of Para, says,—

“The abundance of interesting productions and articles of commerce which *pristine* nature offers spontaneously in Para to medicine and to the arts is extraordinary, though it must be said that its inhabitants, as yet, by no means endeavour to profit fully of this uncommon liberality of the Creator. There are known twenty-three different palm-trees, each yielding fruit, fibres, cordage, oil, and even *spirits*; twelve kinds of trees having a milky substance, yielding india-rubber or other gums; twenty-two kinds of superior timber for ship-building; thirty-four varieties of wood for housebuilding or for canoes, because of its peculiar lightness; thirteen kinds of wood for joiner’s work; and five which are particularly good for making charcoal, besides many other unknown qualities not yet examined, and an immense variety of bushes, plants, roots, &c. In October, 1839, a collection of 340 species of woods was completed in the province of Rio de Janeiro on a surface not exceeding a few leagues. Amongst these there are more than forty known as drugs, and above twenty different containing colouring matter, besides many varieties of *tanins*, &c. Amongst the drugs there exist in abundance two kinds of vanilla, one of the same kind as is exported from Mexico, and resins and balms of various kinds; many odoriferous resins, such as storax, &c.; many kinds of oil-nuts, cocoa, tobacco, cotton, and other fibres, coffee, rice, castor-beans, &c., cloves, cinnamon, and the *matte-plant*; ten known kinds of Chili-peppers, twelve known varieties of

indigenous, farinaceous roots and potatoes in use; twenty-one kinds of fruit-trees in use, amongst which the mango and the bread-fruit; six kinds of bananas and plantains, various kinds of grapes; almost all European vegetables and flowers are grown in the town of Para, and many indigenous, aromatic herbs. Melons and pine-apples grow in abundance."

Live Animals.—Of quadrupeds Signor Baena enumerates thirty-six as animals of the chase or to be hunted, amongst which the largest is the tapir (*amphibious*) the tiger, fox, various kinds of wild boars, five kinds of deer, &c.

Ornithology.—He enumerates 111 kinds of birds; amongst which are many of the pheasant, peacock, and turkey species, and numerous game birds, particularly the black and snow-white *curações*.

Fishes.—He names seventy-six kinds of fish caught in fresh water; amongst them, large quantities of *sardinhas*, and abundance of the *guriuba*, a fish with a yellow skin without scales, which is largely consumed, fresh, dried, or salted; between the head and under the belly, it has a white substance, equal to the Russian *isinglass*, and also used in Para to clarify coffee, wine, &c. The *piraurucu*, is dried like cod-fish, and also exported. The *vacca marinha*, or *manati*, which we have already described, he describes as having a head similar to that of a calf; "it never comes on shore, but lifts its head above the water, and feeds on the plants growing on the banks or in the lakes; the female has breasts, and suckles the young ones; its flesh is like beef. It is the most general animal food, roasted or fried, and is dried and salted, or preserved in its own fat in large vessels. It is also exported. Sausages are also made from its flesh. Some of the lakes are full of them, and many are so large as to yield a pipe of oil." He then describes the several modes of taking them by the Para Indians, and which insure them always a subsistence. Crabs, lobsters, shrimps, oysters, and muscles, he says, are abundant.

Of Reptiles, he enumerates twenty-five kinds; amongst which are twenty-one serpents, including the enormous *boa-constrictor*.

Crustaceous Animals.—Eleven kinds of these are enumerated; amongst them, two kinds of crocodiles, and two of tortoise or turtle; of the first, some are twenty feet long, and afford great quantities of blubber for oil; turtle abound in indescribable multitudes in the rivers Solimões, Branco, Madera, Tocantines, and others. Their meat is said to be very good before they lay their eggs, but not for some time after. From the eggs and from the fat of the animal, the Mantega butter, already described, is prepared in great abundance for general use in the province. It is used for light, and for the food of the poorer classes.

The speckled tortoise also abound on the banks of the Caité, near the River Gurupi (salt water), and between this river and the Bay of San Joas, into which flows the Turicassu.

Live Stock.—Herds of cattle formerly swarmed on the Island of Joanna Marajo; but they are not, according to Baena, so numerous as they have at one time

been. In some cattle-farms on that island they manufacture cheese similar to the *Minas Geraes cheese*, but it is not so good. Nothing has as yet been done for the improvement of the breed of horses. Neither the sheep nor goats are of good breed, and no use is made of their skin and wool. Pigs, though much neglected, are generally of a much larger description than those of Portugal.

CITY OF PARA, AND ENTRANCE TO THE AMAZON.

Mr. Kidder, in 1844, appears to confirm the accuracy of the native geographer, Baena. The former sailed from Maranhão to Para. The voyage was formerly performed by canoes coasting round not less than thirty-two bays, some of them so broad, that the opposite land is frequently invisible.* At present the voyage is performed in a steamboat.

The distance from Maranhão to Para by sea is about 400 miles, and the voyage is performed by the steam-packets in from two to three days. The coast is uniformly low, and much intersected with bays and lagoons. The southern mouth of the Amazon is usually called the Para river. The entrance is intricate, and by no means safe, as there are no prominent landmarks. In the night, or in thick weather, it is almost impossible to discover the only pilot station on the coast, called Selinas, and the pilots are never met at any considerable distance out at sea. The Para entrance lies between the two dangerous shoals of Tigoça and Braganza. Vessels have been frequently wrecked on these, and the crews have sometimes all perished. In descending the river, there is little danger. If the weather is clear, the breakers on the Togoça and Braganza banks are seen, as the tide flows upwards; after entering this mouth of the Amazon the conflict of the ascending and descending waters is called, by its aboriginal name, *pororoca*, and characterises the navigation for some hundreds of miles. No sailing vessel can descend the river while the tide is rushing up from the ocean; and both in ascending and descending, distances are measured and regulated by tides. Para is said to be three tides from the ocean, and a vessel entering with the flood must anchor during two ebb tides before reaching the city. Canoes and small vessels, to avoid any danger from the *pororoca*, generally lay-to in certain places called *esperas*, or resting-places, where the water is little agitated. Most of the vessels used in the Amazon are constructed with reference to its tidal navigation; that is, for floating with the stream rather than for sailing before the wind, although sails may often be serviceable.

The regular ebb and flow of the tides in the Amazon are observed as far as the confluence of the Madera, 600 miles above the mouth. The *pororoca* is much more turbulent on the northern side of the island of Marajo, where the

* The bays and lagoons along the coast, are often connected by intricate streams and channels. The former circuitous voyage in canoes traversed more than double the present direct voyage. The canoes were driven ashore each evening, and the party rested for the night. They were navigated by Indians, who then received only about twopence per diem.

mouth is broader, and the current more shallow. M. de la Condamine a hundred years ago wrote:—

“During three days before the new and full moons, the period of the highest tides, the sea, instead of occupying six hours to reach its flood, swells to its highest limits in one or two minutes. It might be inferred that such a phenomenon could not take place in a very tranquil manner. The noise of this terrible flood is heard five or six miles, and increases as it approaches. Presently you see a liquid promontory twelve or fifteen feet high, followed by another, and another, and sometimes by a fourth. These watery mountains spread across the whole channel, and advance with a prodigious rapidity, rending and crushing every thing in their way. Immense trees are instantly uprooted by it, and sometimes whole tracts of land are swept away.”

On ascending the Amazon, the colour of the water changes from the dark blue of the sea to a lightish green, and then gradually to a dirty yellow. The mouth even of the lesser entrance is so broad, that when above forty miles within it, the coast and the island of Marajo are scarcely visible at the same time. The shores are low, and densely covered with mangroves, with scarcely a settlement, except the village of Collares. The Fort da Barra, where vessels are boarded by revenue officers, is two miles below from the city of Para.

PARA, or the city of Belem, is situated in 1 deg. 21 min. south latitude, and 48 deg. 28 min. west longitude, on an elevated point of land, on the south-eastern bank of the Para river, and eighty miles from the ocean. From the sea it has a very striking and pleasing appearance. The anchorage is good and safe, within an abrupt curve in the channel, which admits vessels of a large draft. The island of Marajo is twenty miles distant, but invisible from smaller islands intervening.

Para, like most Brazilian towns, exhibits whitened walls and red-tiled roofs; it is regularly laid out; and has public squares, called the Palace-place, the Quartel, and the Largo da Polvora, and several smaller squares in front of the cathedral, and of several of the convents. The streets are neither well paved nor wide. There are many large well-built houses, but the back streets consist chiefly of wretched small dwellings.

The best houses are well adapted to the climate, with a wide veranda often extending around the outside of the building; and another, along at least three sides of a large interior area. A part of the inner veranda, or a room connected with it, serves as an airy and pleasant eating-room. The front rooms only are ceiled, except in the best houses. Latticed windows are more common than glass; but occasionally some houses have both; preference is always given to lattices in the dry season. Instead of alcoves and beds for sleeping, hammocks swing across the corners of all the large rooms, and along the verandas. Some houses have hooks for swinging hammocks for fifty or sixty persons every night.

The insurrection of 1835 was greatly injurious to Para. In almost every street there are houses still, battered more or less with bullets or cannon shot. Some have been repaired, others abandoned.

Para fronts the river, and in its rear there is a beautiful shaded walk. The Estrada das Mangabeiras extends from near the marine arsenal on the river side, to the Largo da Polvora on the eastern extremity of the city. It is intersected by avenues leading from the Palace Square and the Largo do Quartel. Its name is derived from the mangabeira-trees, with which it is densely shaded on either side. The bark of these trees is of a light grayish colour, regularly striped with green,—their product is a coarse cotton that may be used for several purposes,—their appearance is at once neat and majestic. In the immediate vicinity of this road is the old convent, now hospital, of San Jozé, and near by it the *recolhimento* of orphan girls. In the grounds of the former establishment a botanical garden was commenced in 1797, for the cultivation of indigenous and foreign plants and trees. The spices and fruits of the East Indies would have flourished here, and, mingled with the botanical plants of the American torrid zone, would have formed a collection unrivalled for richness and variety. But what was only commenced, has been long since abandoned. There are a few private gardens in the vicinity, but neglect of improvement has followed disorders that have for many years prevailed in this town; many streets are overgrown with thick bushes. In the suburbs are forsaken tenements, and the walls of large houses. Beyond the actual precincts of the city, a dense forest commences.

Mr. Kidder says, “The traveller, on entering Para, is struck with the peculiar appearance of the people. The regularly descended Portuguese and Africans do not, indeed, differ from their brethren in other parts, but they are comparatively few here, while the Indian race predominates. The aboriginals of Brazil may here be seen both in pure blood, and in every possible degree of intermixture with both blacks and whites. They occupy every station in society, and may be seen as the merchant, the tradesman, the sailor, the soldier, the priest, and the slave. In the last-named condition they excited most my attention and sympathy. The thought of slavery is always revolting to an ingenuous mind; whether it be considered as forced upon the black, the white, or the red man. But there has been a fatality connected with the enslavement of the Indians, extending both to their captors and to themselves, which invests their servitude with peculiar horrors.

“Nearly all the revolutions that have occurred at Para are directly or indirectly traceable to the spirit of revenge with which the bloody expeditions of the early slave-hunters are associated in the minds of the natives and mixed bloods throughout the country.”

As the aborigines are no longer directly enslaved, they are *daily pressed* for the service of the army and navy.

The large river *canoas* are rudely constructed crafts, with stem and stern square,

the after part rises out of the water like that of a Chinese junk ; over their poop there is a round-house, generally made of thatch, for protection against the sun and the dew, and under which hammocks for sleeping are swung ; sometimes, there is a similar round-house over the bows ; there is also a sort of elevated spar-deck. The steersman generally sits upon the roof of the after round-house. These rude vessels are well enough adapted to their purpose of floating with the tide.

In one part of the city, when beasts are slaughtered for markets, vast numbers of vultures are observed perched upon the trees, or flying indolently in the air. Along the margin of the river, both morning and evening, great numbers of people may be seen bathing. Men, women, and children, belonging to the lower classes, may be seen at the same moment diving, plunging, and swimming, in different directions.

Ponta das Pedras is the principal landing-place, where there are usually numerous canoes and aborigines conversing in the various dialects of the Amazon, and keeping or delivering parrots, macaws, and some other birds of gorgeous plumage, and occasionally monkeys and serpents. They also bring for sale, Brazil nuts, cacao, vanilla, annatto, sarsaparilla, cinnamon, tapioca, balsam of copaiba in pots, coarse dried fish in packages, and baskets of fruits, in infinite variety, both green and dry, with immense quantities of gum-elastic shoes; suspended on long poles.

Close beside the palace there are the walls of a half-erected theatre, commenced 1775. The prison, in the same neighbourhood, bears the date of 1775.

The *juiz de direito* is the chief officer of the police, who examines all passports, and gives a licence of residence.

No monks of any orders are left. The money expended in the erection of the five monasteries in Para, appropriated to secular use, must have been immense.

The cathedral of Para, said by Mr. Kidder to be the largest religious edifice in the empire, was commenced in 1720, and completed and consecrated in 1775 by a bishop, attended by the monks, magnates, and people. Like most of the other churches it is built in the form of a cross.

The *population** of the Comarca of Para, or Belem, in thirty-two villas, seventeen hamlets, and five missionary stations, is stated by Baena, in 1839, as follows:—Free people, 90,767 ; slaves, 26,961=117,728. Comarca of the great island of Joanés Marajos, in five villas and six hamlets: free people, 10,689 ; slaves, 2040=12,739. In the Comarca of the Rio Negro, in nine villas and thirty-eight hamlets : free people, 17,881 ; slaves, 962=18,843.—Total of settled inhabitants in 1839, 149,854.

* The Marquis of San Joas da Palma, former governor of Matto Grosso, estimated the number of the aborigines of Brazil at above 1,000,000 ; of which the by far greater part are in the province of Para and Matto Grosso.

COMMERCE AND NAVIGATION OF PARA.

PARA enjoys one great advantage over every other sea-port town in Brazil, from its unparalleled intercourse by water with the interior. The commercial resources of this country, and the admirable trading position of the city are of the first rank. But the men and people to bring forth the elements of profit and civilisation are wanting. Some Glasgow merchants opened the trade with great spirit, but their property, to the value of about 70,000*l.* sterling, was most flagrantly pillaged during the revolt in 1835. Some American citizens have instituted saw-mills at Maguery, in the neighbourhood. The cotton-wools of Para are admirable. Caoutchouc is abundant, and made into shoes, &c. The following are the articles enumerated by Baena as those exported from Para, viz. :—

“Cotton, rice (large grained), ditto, (small), oil of Andiroba, castor-oil, copaiva-palm, rum, spirits of aniseed, Indian-rubber, painted fruit shell vessels, cocoas of various kinds, cacao, cloves, coffee, crajina, hides, sweet chestnut, cinnamon, horns, casto-rbeans, horses, sweetmeats, farina, tapioca, isinglass, guarana, gums of various sorts, gergelin (*ben oil-seed*), guariuba, tutai-issica, earthenware of Cameta, honey, wax, maquiras, Indian-corn, puriri (spice-nut), piassaba fibres, piassaba cordage. Choice woods, amongst which are rosewood, zebra-wood, and lignum-vitæ, hoops made of creepers, oars, netted hammocks, cotton-spun cloth, sarsaparilla, sumauma, tallow, tonquin-beans, tobacco, tana, tacuaris (cane), tabocas, anatto, calves'-skins, hides, vanilla, Peruvian-bark, tar, turtle-butter, and isinglass.”

The ports to which the above goods are chiefly exported are:—Lisbon, Oporto, Gibraltar, Salem, Nantes, New York, Liverpool, London, Alexandria, Barbadoes, Cayenne, Maranham, Oará, and Pernambuco: the exportation, coastwise, is not accounted for with exactitude. Mr. Baena states the value of exports during the following years to be as under :—

Dollars.		Dollars.	
In 1789, to	286,085 618	In 1816, to	578,928 575
1796,	297,429 127	1819,	452,715 633
1799,	343,672 853	1827,	488,253 758
1806,	785,323 941		

Inland Trade.—While in other parts of Brazil the interchange of goods is impeded by a want of good roads, canals, and navigable rivers, Baena observes,

“The whole province of Para is thrown open in all directions and free from every impediment. Its highways and by-ways are all by water, on bays, rivers, lakes, and creeks, and will remain so as long as the same laws of nature will rule our globe. Nothing is more self-evident than that with such happy topographical facilities, and the fertility of its soil, and the variety of its productions, this province is destined at an early day to carry on a commerce of vast importance. The canoes in 1839 generally employed, carried from 1000 arrobas to above 2000 arrobas, or about forty-five to fifty tons, and the number of their oarsmen were from five to nine Indians. The river barges are only of a moderate date, and are decidedly much more advantageous on such distant voyages.”

The towns of Cameta, Vigia, Macapa, Monte-Allegre, Lantarem, Obidos, Tari Assu and Barra do Rio Negro are the trading places of the interior, but Tari Assu exports nearly all its cotton and cacao to Maranham.

RETURN of the British and Foreign Trade at the Port of Para, for the Year ending the 5th of January, 1845.

The coasting trade between this port and that of Maranhão is carried on by three small ships, who have made collectively, within the year, nineteen voyages inwards and nineteen outwards, and discharging at this port foreign merchandise, during this period, for value of 65,400*l*.

They have loaded at this port produce, during the said period, for Maranhão, for value of 23,760*l*.

During the year we have had the arrival of nineteen steam packets from Rio de Janeiro, and who touch on their voyages, here and back, at the intermediate ports of Bahia, Alagoes, Pernambuco, Ceará, and Maranhão.

BRITISH CONSULATE, PARA, January, 5, 1845.

The general revenue of the province of Para for the year 1844 only produced 142 contos de reis, or 14,791*l*. British sterling; the government expenses for the same period, including troops and navy, amounted to 23,958*l*.; deficiency, 9167*l*., supplied from Rio de Janeiro.

The sugar and coffee plantations do not produce sufficient for home consumption, and supplies of both are imported from the southern provinces.

The imports are all descriptions of manufactured cotton goods, silks, hardware, wines, spirits, porter, salt, flour, salt provisions, furniture, olive-oil, gunpowder, iron in bars, lead, cordage, sail-cloth, &c.

The only manufactures carried on in this province are those of ordinary cotton cloth for sacks and hammocks; Indian-rubber is worked into shoes and into different forms.

There are no public works carrying on in the province, and all those which were formerly executed are fast going to decay.

The naval force on the Para river is only one brig of eight guns and six schooners of from four to six guns.

The military force of the province is reduced to 1300 troops of the line and 1200 militia, but the latter only exists on paper in the government offices.

CHAPTER VIII.

PROVINCES OF MARANHAM, PIAUHY, CEARA, AND RIO GRANDE.

THE province of Maranham is bounded on the west by Para, with the sea to the north, Piauhv to the east, and Goyaz on the south. The River Maranham gives its name to this province. It was first entered by Pinzon in 1500; thirty years afterwards the country was erected into a captaincy; but the first settlement was made by Ravadiere, a Huguenot, who sailed from Bretagne in 1612. Several expeditions having been made to the country, which either failed or perished, Ravadiere and his companions, erected a fort on the present site of Maranham, and built a warehouse and other houses. The French were expelled some years afterwards by the Portuguese; it was afterwards occupied by the Dutch. The early history of the province is a record of misfortunes, cruelties, and nearly at all times of the slave trade.

The coast of Maranham is rendered dangerous by shallows, and, for sailing vessels by the currents and winds. The borders of its numerous rivers are considered fruitful, and it has certainly prospered, when compared to many other parts. Indigenous fruits are abundant. Cotton and rice appear more attended to than any other products. Rice is said to be far better adapted to the soil than the sugar-cane. The province is said to be rich in minerals. Fish of excellent quality is abundant. Sheep, cattle, and horses, multiply fast. The Itapicuru is its largest river. It is rapid, but navigable in the middle parts, by flat-bottomed barges, in the lower by small sailing vessels, and in the upper by canoes. Cotton and rice are the chief crops grown on its banks. It flows down in many parts through a fertile country.

THE CITY OF MARANHAM.—On approaching the coast from the sea, there is a lighthouse at the base of the mountain or hill of Itacolumi, fifty miles from the city. There is another lighthouse on the island of Santa Anna. The bay upwards is decked with numerous small islands.

The village of Alcantara, on the mainland, and the Fort de San Marcos, on the Island of Maranham are then passed, with its battery and telegraph. At Fort San Antonio, situated on the Ponta das Areas, near the city, ships are hailed. The channel leading to the anchorage is intricate and winding.

The city of San Luis de Maranham is situated in 2 deg. 31 min. south latitude, and 44 deg. 16 min. west longitude, on the north-western extremity of the

island of the same name, which is only separated from the mainland by a narrow channel called the Maranhã River. Its population is estimated at 33,000 including a few English and French commercial houses. The city is divided into two parishes, and contains thirteen churches and chapels, three monasteries, one *recolhimento of educandas*, and six hospitals, of which the Misericordia is the principal. It has a lyceum, a Latin school, two primary schools for boys, two for girls, four private schools, and an ecclesiastical seminary, in one of the monasteries. As a city, it ranks as the fourth in the empire.

Maranhã is said to be better built than any other city of Brazil. Mr. Kidder, in 1844, says,—

"It exhibits a general neatness and an air of enterprize, which rarely appears in the other towns of the empire. There are, moreover, within its bounds but few huts and indifferent houses. None of the churches appear unusually large or sumptuous, but many of the private dwellings are of a superior order. The style of construction is at once elegant and durable. The walls are massive, being composed of stone broken fine and laid in cement. Although the town does not occupy a large extent of ground, yet the surface it covers is very unequal. Its site extends over two hills, and consequently a valley. The rise and descent in the streets are in many places very abrupt. Scarcely any carriages are in use, and corresponding to this circumstance, there is only one good carriage road in the entire vicinity. That road leads a short distance out of town. The *cadeira* is but little known here as a means of conveyance. The *rede*, or hammock, is generally used as a means of easy locomotion. It is very common, both in Maranhã and Para, to see ladies in this manner taking their *passeio* or promenade. Gentlemen in health do not often make a public appearance in this style, although it is generally conceded that they are quite fond of swinging in their hammocks at home."

The streets of Maranhã are laid out in straight lines; and by the agency of wind and rain, they are kept clean. The pavements are composed of a conglomerate sandstone, the same that is used for buildings; but as they have no gradings, nor even smooth stones for side walks, they are very tiresome and unpleasant to foot passengers. The town contains several ornamental squares, some of which are bordered with trees.

One of the most picturesque walks within the precincts of the city, is to the public cemetery. The English have also a Protestant cemetery.

CONSUL'S Return of the Trade of Maranhã for the Year 1841 (being an average Year).

NOTE.—Of the 25 British vessels that arrived there were from Great Britain (with merchandise) 17, flour 1, total 18; from Rio de Janeiro (in ballast) 4, from Demerara (in ballast) 1, from Para (with Para produce) 1, from Pernambuco (in ballast) 1; total 25.—Of the 23 British vessels that departed, there were for Great Britain (with cotton and other produce) 19, for Para with part of inward cargo; 2, for Rio de Janeiro (with troops) 1, for do. (in ballast) 1: total 23.

The PROVINCE of PIAUHY lies to the east of Maranhão. It is divided into five comarcas, three of which are said to be kept in an orderly state of administration. The others are usually in the most unsafe condition. This province has but twenty leagues of sea-coast; but it extends to the south and inland about 400 miles. It is generally level, and in some parts undulated. It has extensive unwooded plains, with large herds of cattle. Silver, lead, and iron mines are said to abound. The soil in many parts is well adapted for the cultivation of mandioca, rice, maize, cotton, and sugar-canes. Its principal river is the Parahiba, which flows into the sea by several intricate channels. Its capital is Oeiras, with about 5000 inhabitants. There is no seaport for foreign trade, but it carries on some coasting traffic.

The PROVINCE of RIO GRAND DEL NORTE lies between Parahiba and Ceará. Its coast is uniformly low and sandy; but inland it is described as undulated, and its forests are said to afford the best Brazil wood, and many drugs. The soil is not generally fertile; but the climate is considered healthy. It produces cotton, sugar-cane, rice, and several other articles; the rearing of cattle is in some parts a principal object.

NATAL, the capital, is situated on the right bank of a river, near its mouth. It is an old town, but its population is small. It was a place of importance during the Dutch wars, and its fortress, by which the city is still defended, was then considered the strongest in Brazil. The port admits no larger vessels than 150 tons burden. The foreign commerce of the province is inconsiderable, and there is no prospect of its improvement. Within the limits of this province is Cape St. Roque, which is the north-eastern point of the coast of South America. A large rock marks the extremity of this cape.*

PROVINCE of CEARÁ.—This large province is faced chiefly with white sand-hills, but they do not extend inland. Cotton and dye-woods are the principal exports. The cattle are considered among the best in breed in the empire, and are driven to supply the markets of Pernambuco and Ceará. The carnauba palm, *caraphera linifera*, is a beautiful tree, and is said to rival the cocoa palms. They also furnish food, building materials, and raiment. Besides the edible nut, or the fruit, the *palmito*, the tender extremity of the flowering branch, is deemed delicious eating. These palms have trunks remarkably regular and strong, and serving either for fuel or building timber.

* The Island of Fernando de Noronha, which lies about seventy leagues north-east from Cape St. Roque, in south latitude 3 deg. 56 min. This island has been successively under the dominion of Portugal, Holland, France, and Brazil. It is about twenty miles in circumference. Many little islets are divided from the principal island, and from each other by narrow channels. They are all rocky and barren, although frequented by vast numbers of sea-fowl. There is good fishing round it; and it has two harbours, but not very safe in stormy weather, and looks at a distance like a great church with a steeple. It has long been a place of exile and imprisonment. The Portuguese had formerly no less than seven forts. No woman is allowed to land on this island. There is a garrison for preventing the escape of criminals.

"The great natural advantages of this province," says Mr. Kidder, "must be noted among the existing causes of its low state of improvement. The stern voice of necessity, 'work or die,' never disturbs the day dreams of the Brazilian, as he yawns in his hammock during the bright hours of sunshine. The great mass of the lower classes live as they list. Their wants are few and simple, and to a great degree conformed to the spontaneous productions of nature. Multitudes of Indians inhabit Ceara, in a state of semi-barbarism. As a general rule, they are idle and vicious, living chiefly upon indigenous fruits, or those which are cultivated with scarcely any trouble—but seeking occasional plunder."

Formerly the aborigines were under a careful regulation, and were *hired* to work on the plantations. This superintendence has disappeared,—the wretched beings are in a state of utter neglect and indolence, and no efforts are made for their instruction or improvement. Slaves are comparatively few in the province. This is lamented by the people generally, as a great calamity; but indolence enough prevails, and it would be cruel to enslave others to increase the laziness of the free population. The *melancia*, or *water-melon*, is produced here in profusion. These melons are eaten as a principal article of food, especially by the Indians and mixed races. They are so abundant, as to be sold frequently at the rate of twenty cents per hundred. For a penny may often be purchased as much as would feed a man for a week.

Mr. Kidder says,—

"Thousands of these people, in the interior, have never seen the article of bread. An anecdote was related to me of a matuto from the far sertão, who, on visiting Aracaty, resolved to gratify his curiosity respecting what he had so often heard of as a great foreign luxury. He accordingly went to a baker's shop and purchased a hat full of rolls, and then seated himself under a tree and commenced paring them, as he would oranges or bananas. The taste, however, did not please his palate, and he soon threw them away as unfit to be eaten."

The freshets and the droughts are considered the scourges of these parts.

"During the droughts," says Mr. Kidder, "years have been known to pass by without rain. At such times vegetation perishes, and both animals and human beings die off without number. It was painful to listen to the descriptions given of these *seccas*, and the famine consequent upon them. I was prepared to understand them by the details previously given me of a similar scene, which a gentleman, with whom I met in Pernambuco, had witnessed a few years previously in Rio Grande do Norte. Absolute starvation prevailed in the country, and the only hope of the inhabitants was in finding their way to parts of the coast to which supplies had been brought from abroad. Hundreds died upon the way, and their emaciated corpses were scattered upon the sand, often without interment, but so emaciated and withered as scarcely to taint the air, or offer a banquet to the worm. Some who had strength to arrive, and money with which to purchase food, survived. Others arrived too late, and being so exhausted and enfeebled, that the morsel which they craved to sustain life only served to hasten their dissolution."

The province of Ceara contains, by estimation, 180,000 inhabitants. In 1841, it possessed thirty-one primary schools, frequented by 830 pupils; and Latin schools, with forty-six pupils. The House of Correction belonging to the province, was occupied by eighteen delinquents. Its prisons were few,

and generally insufficient to prevent the escape of criminals. The following is the official list of crimes committed during the year, between July, 1840, and July, 1841:—Murders, seventy-two; attempt to murder, fifteen; threat, one; serious wounds, twenty; light wounds, twenty-four; physical injuries, four; robbery, ten; theft, seventeen; rape, three; calumny and injury, eight; use of prohibited arms, two; prevarication, one; disobedience, fifteen; defalcation, two; abuse of authority, one; sedition, one:—total, 196.

Speaking of religion,—

“ ‘The unquestionable fact,’ says President Coelho, ‘is not only chargeable upon a clergy (with some honourable exceptions), of being ignorant, depraved in habits, corrupt in morals, involved in the concerns of the world, and totally forgetful of their heavenly mission; but it is also due to the indifference with which the legislature treats the wants of the church.’ ”

“Not long since a proposition was made to the National Assembly to erect a new inland province. A desire for improvement is said to prevail in Ceara, and various enterprizes have been projected; but the depressed state of its finances has prevented their completion. The reflector, and other apparatus of a light-house, which is very much needed on Point Micoripe, had been imported from England, and lain in the custom-house four years for want of funds to put it in operation. Lamps and fixtures for lighting the streets of the town had been provided; but up to the present, there was a lack of funds to supply them with oil. There was not a single cemetery or graveyard for the use of the city. All the interments were made, from year to year, in the solitary church of the town, which was thus rendered, as the president expresses it, ‘the very focus of putrefaction and pestilence.’ ”—*Kidder*.

The town of Ceara is situated in 3 deg. 42 min. 58 sec. south latitude, and 38 deg. 34 min. west longitude. Its port is difficult to find, from there being generally a thick haze over the land. Its landmarks are the point of Micoripe, on the south, and the inland mountain-peaks of Mararanguape, to the north. These are the only high mountains seen near the coast north of Bahia. They mark the termination of the great Serra do Mar, which ranges through at least twenty degrees of latitude, in some parts approaching near the ocean, in others inland.

Ceara is frequently called Fortaleza, after an old fortress erected near to defend the harbour. Little of the city is visible from the sea, except this fort and the few huts which line its sides. On the left of the town there is a small river, whose banks are adorned with *coqueiros*.

The public buildings are not large, and are constructed in the usual Brazilian manner. The city does not contain a convent, nor any monastic edifice. This remark applies to the whole of Ceara, but to no other province in Brazil. The only finished church in Ceara is that of Nossa Senhora do Rozario, the especial protectress of the negroes. That of the Conception, frequented by the whites, was a few years ago pulled down, in order to be rebuilt on a larger scale; but the work stopped when the walls were about half erected, and still remains in that condition.

The Bay of Ceara opens to the north, forming a regular and spacious semi-

circular form. The harbour is protected and screened by a reef of rocks under water. It is said to become annually shallower from the sand filling it up.

Mr. Kidder says, in 1842,—

"At the time of our arrival, a few coasting-smacks and an English brig were all the vessels in port. The landing is nowhere good, on account of the heavy surf that continually breaks upon the strand. Adapted to this, the pilot-boat in which I went on shore was guarded by strong outriggers to prevent capsizing, but even then did not willingly come in contact with the shore."

After conveying passengers from the ship to a fordable depth, they are landed in a *paviola*, a kind of chair elevated on poles, and carried by four men in the same manner as a *bier*.

The PROVINCE OF PARAHIBA comprehends the larger portion of the old captaincy of Itamaraca, and extends west nearly 200 miles to the boundary of Ceara. The River Paraiba, or Parahyba, which rises in the Serra do Jabitaca, flows to the north-east, and falls into the Atlantic by two channels, divided by the island of St. Bento. The coast of Parahiba extends about sixty miles along the shores of the sea and bays of the town.

The absence of industry and the state of morals in this province has been severely animadverted upon in Brazil, and instead of justice being enforced by the laws, it is said that parties take not summary justice, but revenge into their own hands. Religious observances, fêtes, and processions, are, however, common.

Mr. Kidder, who gives the most recent account of this province, sailed to it by a singularly-built vessel, a sort of catamaran, called in Brazil, a *jangada*.*

"When," says he "about to embark from Itamaraca, I found it as necessary to secure a good *jangada*, as it would be in New York to select a choice berth for a passage to Liverpool. The *Paquete do Norte* was recommended to me as one of the finest craft owned on the island.

"On its being chartered expressly for a passenger, the proprietor proceeded to fit it out in extra style, by putting a *girau*† upon it."

* "A voyage at sea upon a *jangada* is not an incident of every day's occurrence, at least with North Americans. Nor is it easy to convey in words a perfect idea of the simple and singular structure by which the savages of Brazil were accustomed to traverse the waters of their coast hundreds of years ago. Although in constant use since the period of discovery, the *jangada* has preserved its aboriginal form and style of construction, and even in this age of improvement is not likely to undergo any change for the better. Properly speaking, it is merely a raft, composed of unhewn logs of a peculiarly light wood, called *pau de jangada*. Trunks of trees are selected, about six inches in diameter, as nearly straight and uniform as possible. These are stripped of bark, sharpened at each end so as to cut the water, and then fastened to each other by three rows of transverse pins. The number of logs used is generally six, although I have seen them composed of three, four, seven, and even twenty logs. These latter are used as lighters for unloading vessels, and are nearly square in form, while the sailing *jangada* is rectangular, and generally about five feet in width by sixteen or twenty in length."—*Kidder's Brazil*, 1844.

† The term *girau* is entirely technical, being used to designate what in English it would be difficult to name, unless it were called a suspension cabin. Its construction was in this wise: two strong poles were lashed one to each of the stanchions or sticks just mentioned, at the height of eighteen inches, and thence slanted forward till they rested upon the logs near the mast. Across these were fastened boards making a floor. Over-head sticks were bent to support a cover, not dissimilar in appearance to that of a travelling waggon; thus a space was left for the passenger about three feet in height and four in width. A thick rush mat was then spread on the bottom for a bed, and another over the top as an awning, to which, in case of rain, an oilcloth

They sailed by moonlight, with a tolerable breeze from the land, and as these coasting craft pass usually within the reefs which lie off the shore, they seldom encounter a rough sea. He passed the several little ports of Barras Pontas, Pedros Guyanna, Gracire, Pildinhu, &c.

Every village along the coast was adorned with its grove of cocoa trees. Several *jangadas* engaged in fishing were also passed. The coast presented sandy beaches, now and then intercepted by perpendicular bluffs of red soil, from twenty to sixty feet high, over which, to their verge, grew shrubs. On doubling Cape Blanco, he was landed at Tambuin, only six miles, across the country from Parahiba, whereas the voyage by sea would have been thirty to forty miles round another cape. Not being able to procure horses, he, with some others, walked to the city of Parahiba. He tells us,

“ My *companheiros de viagem* having determined to walk up to the city in my company, they proposed to carry my baggage, and divide between themselves the price offered. This suited me, and we started off. I had worn my tall *Paulista* boots on board the *jangada*, to protect myself from an occasional wave, and I now proved their value on shore ; for although we were on a royal road (*estrada real*) we were obliged to wade streams occasionally.

“ On leaving the sandy regions of the beach this road became very pleasant, although it was a mere path winding through an almost continuous forest. After the day’s confinement within the narrow compass of my *girau*, walking was agreeable. The six miles soon disappeared behind us, and we began entering the suburbs of the city before we were really aware of it. On inquiring for an English gentleman to whom I had a letter, I was directed to his *sítio*, near where I entered the town, and finding him at home, was once more welcomed to the hospitalities, I like to have said, of a fellow countryman, for such truly do Englishmen appear and prove to us when abroad. The *sítio* of Mr. R., which at Bahia would be called a *roça*, and at Rio de Janeiro, a *chacara*, occupies the finest locality in Parahiba. It is situated on the brow of the hill, within the bounds of the upper town, and commands a view of the ocean on the north, the Cape and Fort Cabedello, the mouth and course of the river, up to the shipping before the lower town, including at the same moment a boundless and diversified landscape. The view from this place often reminded me of the far-stretching plains lying west of the Genesee river, as seen particularly from West Avon. Mr. R. was giving especial attention to the cultivation of his grounds, and planting many coffee trees, which, although they grow and produce luxuriantly, are but rarely found in any of the northern provinces. It is a singular circumstance, that coffee is retailed at a higher price in Pernambuco than in the United States. Orange trees suffer very much from the depredations of the ants, being sometimes stripped of their entire foliage in a single night. When a tree has thus been visited three successive times, it does not survive. My friend also had many of these invaluable fruit trees, while his place furnished a vegetable garden, fine springs of water, a yard of cows, and other valuable appendages of rural life, so that he might be truly said to have *rus in urbe*, ‘ a farm in the city.’ The house was large and airy, with brick floors, latticed windows, and no ceiling above, save in the parlour.”

CITY OF PARAHIBA.—The harbour of this town is ten miles below, within the bar over which vessels of considerable burden may pass, and smaller vessels

could be added, so that all might be kept dry. Thus rigged, my paquete was ready for sea. The only additions needed for purposes of navigation were—first, a setting-pole, to push off from shore ; second, a slender mast, and a three-cornered sail to catch the breeze ; and third, a long, broad oar, to serve as a rudder. Its crew consisted of two men, the *proeiro* and *palrao*, or the bowsman and steersman.

ascend to the town; the river navigation upwards is performed in rude boats or canoes. Mr. Kidder was in this city during one of the many fêtes. In the evening, he says,—

“The Matrix church, at which the fête was held, was situated near by. It stood at one end of an oblong area. Its front was illuminated by candles hung in broken lanterns around the door, and burning before an image in a niche attached to the cupola. Large fires were blazing in different parts of the area. Around them were groups of blacks, eager to fire off volleys of rockets at appropriate parts of the service that was going on within the church. After the *novena* was finished, all the people sallied out into the campo to witness the fire-works. These commenced about nine o'clock, and continued, I was told, till after midnight.

“Had this been a scene of professed diversion for a company of rude and ignorant Africans, it would have been more sufferable. But professing to be part of a religious service (*honra á Nossa Senhora Padroeira*) performed on God's holy day, and joined in with enthusiasm by priests, monks, and people, I confess it shocked my feelings in the extreme, and I wished myself almost anywhere rather than witnessing it. Whole families, including mothers and their daughters, were out in the damp night air to gaze upon spectacles partaking of the lowest species of the ludicrous.

“The next day on horseback, accompanied by Mr. R—, we passed through the principal streets of the upper town, in which are the convents, the prison, misericordia, treasury, palace of the governor, and several churches. Thence we passed out on the road leading towards Pernambuco, about three miles, to a large *cruzeiro*, called *crux das almas*, cross of souls. Here we turned to the right, and descended to the low grounds on the bank of the river, which we followed back to the lower town. The river is very winding, and is not navigable beyond the present anchorage. Canoes go up a long distance, although in the summer season the bed of the river becomes dry beyond twenty leagues. Its prevailing course is north-west, and the town is situated upon the southern bank. One of the finest buildings it contains is a *new trapiche*, or government warehouse. In front of it were three English vessels anchored, loading with cotton and Brazil wood. They were the only vessels in port.”

Extending from the river, two streets contain the principal buildings and commercial establishments of the lower town. Several houses were then in process of erection, rents were high, and landed property had recently been on the rise. The number of inhabitants is less than in the upper town. The elevation of the latter above the water is about 200 feet, and rises rather abruptly. The military arsenal, a large yellow building, is beautifully situated, in a level area, between the two towns. The public edifices of the upper town and lower town, are built in the style usual in the Brazilian cities, and the treasury has in front a high flight of steps by which it is entered. The streets are wide, and paved with a kind of clay slate, much worn. The old *gelousias*, suspended from projecting cornices of thick carved stone, are still seen at Parahiba, which in its general aspect, is like our towns.

Mr. Kidder says, a gentleman just returned from a journey into the interior, described the state of morals and civilisation in the sertoes of this province, and of Rio Grande do Norte, as shocking in the extreme:—

“In those wild and thinly populated regions, where the traveller ferrets out his lonely path through the forests for leagues upon leagues without seeing a habitation, it would be natural to suppose that among the few existing inhabitants there would prevail great fraternal love and harmony, especially in view of their all being bound together in

the unity of the one church, at whose shrines they are all baptised and all confess: Yet, unhappily, intrigue, discord, and murder, seem to be the order of the day. Revenge arrogates to itself the administration of justice, and crime of the deepest dye tramples upon law, and sets its execution at defiance. The most trifling affront is followed by murder, and any man's life may be sold to hireling assassins for a pitiful sum."

Enormous sums were expended in the erection of monasteries in this province. Most of them are now going to decay. Mr. Kidder says, in some which would accommodate 200 monks, there are not more than from four to six. He says—

"The government has shown its discretion by appropriating them to purposes of business and utility wherever it has had occasion. This province, following the example of some others, has given each convent the privilege of matriculating nine novices—hitherto without effect. '*Ninguém quer ser frade*'—'Nobody wishes to be a friar,' is the common remark. Although a life of ease and virtual opulence would thereby be secured, yet such was the public and private dislike of monasticism, that, as yet, no one was willing to share its inglorious spoils."

The monastery of San Bento has only a single tenant, the abbot.

"This order here, as in almost every place where it is established, possesses *engenhos* with slaves and large landed property in the vicinity. The Carmo convent was without an inhabitant, save some troops quartered in it. The prior was recently deceased. He was described as a notorious *bon vivant*, answering fully the idea of a 'jolly fat friar.'

"As I one day passed by the prison, it appeared to be full, both above and below; and, to judge from the loud talking and laughing within, it might have been taken for a place of amusement."

Cotton and sugar are the principal exports of this province. The sugar estates do not extend far towards the interior, on account of the expense of conducting their products to market. What sugar is made beyond the circuit of from fifteen to twenty leagues, is consumed in the form of *rapadura*, as the unclarified article is denominated. It is generally moulded in small cakes. The kind of beer, or spirit, called *caxaça*, is increasing both as regards its manufacture and in the quantity drunk. Speaking of the food of the people, Mr. Kidder says—

"The chief peculiarity which I observed at the table in these regions was a fondness for peppers, which even in Brazil, might be considered extreme. In addition to being bountifully served up in every dish, a pure decoction of this vegetable, in the form of gravy, containing sufficient *fire* to consume an unpractised palate, was deemed an essential dressing.

"*Farinha de mandioca* was much used, with a preparation of oil, pepper, and vinegar, called *farrofa*."

A great many persons, of Indian descent, are seen in Parahiba, although it is often difficult to distinguish them from the Portuguese on the one hand, and the negroes on the other, with both of which races they are amalgamated.

Mr. Kidder returned by land to Pernambuco, and describes the incidents of his journey, from which we condense briefly the following. He praises the horses generally; yet he was cheated in the one provided for him, and was accompanied by a mulatto guide.

"On entering the first piece of woods, we passed two men armed with swords and guns, of whom I had no favourable impressions, although they were talking cheerfully, and did not molest us. Pacifico afterwards told me that they were hunters, on their way to secure game (*bicho do matto*). By and by the sky began to redden, and daylight

soon appeared. I now had an opportunity of observing our condition and appearance. I found myself to be astride of a genuine Rosinante, whose beauties and whose virtues would not have suffered in comparison with those of the original steed of the knight of La Mancha. At the same time, the horse of my man, Pacifico, was a worthy companion.

"Several showers occurred during the morning; and between bridgeless rivers and wet bushes, through which we are constantly passing, my feet became very wet, notwithstanding my high boots. At the distance of four leagues, we passed through an Indian village called *Jacoue*. It had a church, school, and some ninety or one hundred houses built in the ordinary style of mud and thatch. At nine o'clock we arrived at *Terra Cavada*, the name of a *sítio*, to the owner of which I carried a letter. The senhor was not at home, but as it was raining, I did not scruple to accept the kindness of his good lady, who ordered a hammock to be suspended for my use while the horses could eat and rest. The situation was beautiful, and the whole vicinity seemed to be a plantation of *bananeiras*. The house was among the most indifferent objects in sight.

"At eleven o'clock I was ready to resume my journey; but just at that moment I received an intimation from Pacifico that breakfast was preparing, and that we must consequently wait. The repast was straightway served and well relished.

"At twelve o'clock we were again on our way. The rain had ceased, the bushes had become dry, and all nature had put on a more cheering aspect. The face of the country was undulating, sometimes presenting a hill-side covered with *denden* palms, or an opening sprinkled with mangabeira trees; and anon a dense impenetrable forest of varied foliage.

"I frequently saw large *copim* or ant houses, both upon the sides and in the tops of trees. In form they resembled wasps' nests, although they were much larger, and made of earth. In the course of the afternoon I observed a flock of large parrots, and some other birds of gay plumage; also, a monkey passing over the road just before me, upon the connected branches of trees.

"About two o'clock we passed another Indian village, called Alhandra. It might have had a thousand inhabitants, but they were by no means exclusively Indians. The place appeared, in all respects, like the common *provoacoes* and *villas* of the country. About five o'clock, P.M., I arrived in sight of Goyanna, a town ancient and celebrated in history. It presents a lovely aspect when seen from a distance, but of that kind which gives a very false idea of the reality. All the Brazilian towns have two peculiarities which add to their external appearance, first, the buildings have a uniform colour, white; second, every eminence or prominent point within them is adorned with a temple of antique structure.

"Goyanna is a *Cabeça de Comarca*, or shire town. It is four leagues from the seacoast, fourteen from Parahiba, and fifteen from Recife, situated between two small rivers. In it resides a judge of civil, and another of criminal law, who preside at the sessions; also, a prefect of the police. It has a Latin school, two primary schools, a *recolhimento*, hospital da misericórdia, convent of reformed Carmelites, and five churches.

"On entering the town it proved to be miserable and dirty. Almost the only building which did not appear to have a downward tendency, was a new prison going up. Pacifico conducted me to the best, and perhaps the only establishment in the place in which we could be accommodated for the night.

"The road, often crossing a stream or a canal, lay through a forest for several leagues, being wider than before. The air was fresh and balmy, and numberless birds of plumage and of song enlivened the scene: The soil was sandy, the surface level, and considerable hewn timber was scattered along the road. After proceeding two or three leagues, houses became more frequent, almost all of them exhibiting a bottle or jug at the window, as a sign that ardent spirits could be bought within. I saw frequent flocks of parrots and paroquets. The natural cry of the former resembles that of the common hawk. The day was beautiful. I overtook, and for some time accompanied, a troop of *sertanejos*,* whose horses were loaded with bags of farinha de mandioca and bales of cotton. In this manner nearly all the products of this province and Pernambuco are carried to market.

* The term *Sertanejo* signifies an inhabitant of the *Sertão*. It is considered more dignified than *matuto*, and is applied to proprietors in the interior.

I was not a little amused at their manner of mounting. When, on account of a high load, they are unable to spring on at one leap, they take hold of the horse's tail, place their foot upon the gambrel joint, and walk up over the hips of the animal. About noon we came to an *engenho* denominated *Caga Fogo*, which appeared more as every Brazilian plantation might and ought to appear, than any other I saw in the country. The house was low but large, and neatly whitewashed, with green doors and window-blinds. It was located in the midst of an extended and fertile valley, surrounded with the proper out-houses, flanked on the one side by a splendid field of sugar-cane, and on the other by green pastures, extending to the brow of the neighbouring hills, and sprinkled with grazing herds. Near by was a fine pond, furnishing water-power for the sugar-mill and similar purposes, while its dam answered as a bridge to the stream, having a waste-weir for the surplus water.

The next place, the village of Pasmodo, is remarkable for the manufacture and sale of great numbers of the knives (*facas de ponta*) which it is the passion of this people to carry, in a silver-mounted sheath, by their side, and their vice to use too often for desperate purposes.

"We at length paused at Itabatinga, near to Iguarassú, where my guide left his horse, preferring to carry the cloak and portmanteau himself, rather than to attempt getting the jaded animal any further. I tried in vain to get an exchange for mine. In front of the house where we stopped was a cattle fair, which had collected a number of spectators. It seemed to be a branch of the weekly fair that is held at *Pedras de Fogo*, a place seven leagues beyond Goyanna. At that place vast numbers of people collect every Wednesday and Thursday for the general sale, purchase, and interchange of commodities furnished and needed by the *sertoens*. As a means of judging of the concourse of people who assembled there, I was told that sixty or seventy oxen are frequently slaughtered on the spot for their sustenance.

"Inguarassú is located upon an elevation, at the foot of which flows a small river of the same name, crossed by an ancient but very good stone bridge. It is a league and a half from the sea coast, and six leagues from Pernambuco. It is at present a villa, has a primary school, a convent of Antoninos, recolhimento, misericórdia, prison, town-house, mother church, and four hermidas, or filial churches. It has the air of antiquity, and is on the decline, having but little business. I observed one temple with its roof fallen in.

"Soon after passing Iguarassú, I overtook a troop of a dozen horsemen; several blacks were riding forward, and their masters in the rear. In front of all was a drove of cattle, which I supposed to belong to the party, but which it appeared did not, being soon left behind. I ascertained that the cavalcade was from Assú, in the province of Rio Grande do Norte, eighty leagues distant, and on its way to Pernambuco to purchase goods.

"During the several hours we rode in company, the moral condition, and the civil relations and prospects, both of Brazil and the United States, were thoroughly discussed. We had, in the meant time been travelling over the table lands, where *engenhos* and habitations of different kinds were somewhat frequent amid a succession of clayey hills. At length the Rio Grandenses stopped for the night, and I had yet three leagues between me and the Recife. Notwithstanding a ride of nearly fifty miles since morning, my Rosinante still kept upon his legs. This was nearly all I could say in the beginning; but it was now evident that, notwithstanding his appearance, his capacities for a *long run* were second to those of but few horses in the country.

"Just before dark I passed the *correio de governo*, or government mail, which was a species of leathern trunk, strapped on the back of an Indian on foot. This is the usual method of conveying the mails in these regions; and, in addition to that of the government, there is a weekly post of the same description between Pernambuco and Parahiba, supported by the merchants. We at length arrived in Olinda."

TRADE AND NAVIGATION OF PARAHIBA.

EXPORTS from the Province of Parahiba during the Year, terminated December, 31, 1844, together with their estimated Value in Sterling at the place and time of Shipment.

CHAPTER IX.

PROVINCES OF PERNAMBUCO AND ALAGOAS.

THE province of Pernambuco has constituted one, if not the most important, part of the Brazilian empire since the period of the Dutch conquest. It abounds with many good harbours, and the soil is very generally fertile. Its capital has been called the Tripoli of America.

The province of Pernambuco, as reduced by the separation of Alagoas, is divided into thirteen comarcas, viz., Recife, Cabo, Rio Formoso, San Antao, Bonito, Limociro, Nazareth, Puo d'Alho, Goyanna, Brejo, Garanhuns, Flores, and Boa Vista; the free population of the whole is stated by Mr. Cowper to amount to 600,020 souls (exclusive of foreigners); the basis of this calculation is the census taken in 1842, the period of the election of the legislative assembly of 1846, which gave for the whole province, 120,004 hearths, and upon the calculation made of there being five persons to each hearth: viz., the husband, wife, two children, and one domestic. This last census, according to the best informed persons, is as nearly exact as can be ascertained. The number of slaves is by some calculated to exceed by two-thirds, the free population, others increase this estimate, but the former proportion may approximate more closely to the true number. The greater portion of the slaves are employed in the 512 sugar plantations, which this province contains, and in about 200 small engenhos in the western comarcas, where the coarser kind of sugar is manufactured for the consumption of the inhabitants of the *Sertos* (or mountainous region), in the provinces of Piauhv, Ceara, &c. The other predial slaves are employed in the cultivation of cotton, mandioca, vegetables, &c. In the comarca of the Recife, which possesses many extensive plantations of sugar-cane; the cultivation of farinha, vegetables, fruit, &c., for the consumption of the Recife and Olinda, with their suburbs, forms a gainful pursuit to the agricultural people.* The island of Itamaraca, in this comarca, is remarkably fertile, producing tropical vegetables of every description, and is celebrated for the superior flavour of its grapes and other fruits.†

* Mr. Cowper's reports.

† Mr. Kidder revisited this island in 1842; his sketches are very graphic, and can ably afford extracts. He says—

“ My passage to the island had been engaged by a friend; and about noon of a fine day, I was hurried to embark on board the canoe, San Bernardo, with the intelligence that the tide having begun to flow, now furnished the most favourable opportunity for sailing. The wind was blowing almost a gale, and the idea of going to sea in a canoe did not seem very inviting. But on entering the craft all my apprehensions subsided. I found it not less than seven feet wide by about twenty-five in length; yet it had been formed out of a single tree, and was much shorter than some others to be found on the same coast. These canoes are worth from 500 to 1200 milreis

The comarcas of Cabo and Rio Formoso possess the greatest number of sugar engenhos, having a considerable extent of sea-coast, and many rivers with tributary streams. The facility of transporting the produce to the Recife, offers an advantage, to the proprietors of the plantations, of much importance. In the latter comarca is the small town of Una, so notorious by the situation of its small but secure harbour, in which the slave-vessels may with safety land their

each. The one in question was valued at 800 milreis. It had a short deck at each end, forming beneath, what I will call the fore and after cabins, midships being entirely open for cargo. This canoe carried an immense triangular sail and a jib, and had on each side an *embono*, or buoy, made of two large trunks of the jangada wood fastened together, and lashed to the upper edge to prevent capsizing. It was navigated by three men. The captain was a mulatto, and his two men were negroes. They carried, besides myself, two watermen as passengers. In going out, we passed alongside the *Regista*, to exhibit the despatch of the vessel.

"We immediately bore away to the north, taking no notice of reefs or shallows, presuming they would not interfere with the slight draught of the canoe. There seemed to prevail the greatest harmony between the captain and his men, without any of those troublesome ideas of rank and authority which commonly prevail on salt water. After satisfying my curiosity about the mode of navigation, and enjoying the fine views furnished as we were standing off Olinda Point, I took undisputed possession of the after-cabin, and extended myself for a nap. The swell was very heavy, as we were in shoal water, and off extreme points of land; nevertheless, our craft being light, shipped but little water, and we rode gaily over the surges. When I afterwards arose we were off *Pau amarello*, a fort and village of the same name, both distinguished in the history of the country. The island to which we were bound was just in sight from the top of the wave. About four o'clock we landed at the *Pilara povação* (settlement), so called after a church of *Nossa Senhora do pilar*, having completed the voyage of eight leagues in four hours. The whole coast in this part of the island is planted with cocoa-nut trees, in the shade of which are clustered a great number of huts and houses. I took a turn through the village. I found it built without the least regularity along paths winding in different directions. The church was rather an ancient building, with heavy walls, and a deserted aspect. Opposite, stood the theatre, apparently enjoying a much greater degree of prosperity. The houses generally appeared on the outside as if built entirely of the cocoa-palm leaf, but, in fact, this material only covered the sides, in the same style as thatch did the roofs."

He says of a senhor's house—"This domicile was of rather a superior order for the place, being built of strong taipa walls, whitewashed without, and having a good tiled roof. It had two front rooms, and more or less in rear, with an enclosure of a few rods of ground for a garden. Senhor M. was a man of about fifty years, short, thick set, and pleasant, although decidedly homespun in his manners. His family consisted of a wife, a daughter, and five grandchildren. The daughter, about a year previous, had been left a widow, and had returned to the paternal roof with her children. These children were pretty, and more than ordinarily intelligent in their appearance. After supper, which consisted of hard biscuit and butter, with tea, a *rede* (a hammock) was suspended for me from rings at opposite corners of the front room. This was the first time I had slept in one of these swinging beds, which are the true fashion of the country.

"*Fisheries*.—The fish-pen (*curral de peixe*), is made by stakes driven into the sandy bottom. Small rods are attached to the stakes by means of cross pieces and withes, and brought so close to each other as to prevent the passage of any but the smallest fishes. The rows of stakes generally commence at the Praya, and run in a right line into the sea, some ten, twenty, or thirty rods, according to the depth of water, and thence describe an enclosure, in some form between a square and circle, with openings towards the land. Into these the fish run with the ebb-tide, and are then easily taken in a net. The privilege of building these curraes is licensed by government. Sometimes a place is found for them a long way out from shore, and one or two that I saw appeared to be on the reef itself, or some branch of it, not less than half a league distant. Being constructed of stakes of equal length, some of them appear very well at a distance, and not unlike fortifications. A great profit is generally realised by their proprietors, and occasionally 200 or 300 milreis per day. When, however, their products fail, it is a public calamity to the community of islanders and coast residents, whose principal articles of diet are fish and the cocoa-nut.

"There are several churches in the island, and very many of the houses have their saint or tutelary deity.

"On the second day, having engaged a horse for riding, I proceeded about two miles along the southern shore, alternately in paths among the cabins, and upon the hard white sand of the beach. The dwellings extended with more or less regularity the whole distance, while I had the day

unhappy cargoes. The municipality of Sireinhaem is famed for its fruitful soil, the small river of the same name running through the valley irrigates the land, and adds to its fertility, especially during the dry seasons. In the comarcas of Nazareth and Puo-d'Alho are some sugar engenhos, many cotton plantations, and extensive fields of farinha de mandioca. The comarcas of Bonito and Limociro have a few sugar estates; in the latter, the cultivation of cotton is principally attended to. The comarca of Goianna, named from the town of that name, formerly a city of much importance, has a considerable number of large sugar engenhos; most of them have the advantage of water-conveyance by means of the River Goianna, at whose mouth is the small port of Catuama, another favourite spot at which the slave-merchants order their vessels to disembark their cargoes. At Pedras de Frego, situated at the line of division between this comarca and Parahiba, is held the greatest cattle-fair in this or the adjoining provinces; the town is, in consequence, rising in importance. The sertão of the province comprises an extent, from north to south, of fifty leagues, and 147 leagues from east to west. Many parts of the interior, far west, were little known till the year 1815, since which period, it has increased in wealth and prosperity. The Sertenagos are a fine muscular race; sober, steady, honest, and indefatigable in their occupations, either attending to their horses and cattle, of which they have considerable herds, or occupied in their cotton, or vegetable

before found them in the same manner a mile and a half to the westward. Thus it may be said, that the whole eastern shore of Itamaraca is covered with habitations, embowered in the shade of one continuous cocoa-grove.

"Nothing could be at once more useful and ornamental than these magnificent palms. They are planted in regular lines, and grow to a nearly uniform height. Their trunks are slender and limbless, marked only by regular scars left in their growth, as one set of deciduous leaves falls off, yielding the precedence to another. Quite in their lofty top the fruit is clustered. The leaves, though simple and plume-like in form, are majestic in size. They stretch in various curves from the common centre of each tree-top, so as to unite their extremities, and form an umbrageous canopy so dense as to be scarcely penetrated by the rays of a vertical sun. These bowers are ever-green, and whether illuminated by sun, moon, or star-light, they shed down by varying reflections a sombre brilliancy, calculated to chasten the feelings and soothe the heart. Throughout all this vast arena the grass grows wild, and the turf is intersected by narrow, winding paths, exhibiting a white sandy bottom beneath. Here the mild air of the grove is freshened by an almost unceasing breeze from the sea, while he who enjoys it can look out upon a boundless expanse of the ocean, heaving its restless tide, and breaking into foam over the coral reefs which girt the island. The strip of the shore planted with coqueiros, varies from forty to one hundred rods in width. Beyond this, the prevailing tree is the *cajueiro*, or cashew, which, together with the vine, the mangueira, and other trees, produces fruit in great abundance and perfection.

"It was the lamentation of every one I met, and especially of mine host and hostess, that I was not there in the summer, the season of fruit.

"Many remarks might be made respecting this interesting island. I shall only add a few on the state of society. The great majority of the inhabitants are watermen, and employed more or less upon the fisheries. They seem to abandon themselves very much to the luck of their profession, and to have very little idea of regular and persevering industry. What little labour the men perform on shore is generally done mornings and evenings. After the sun's rays begin to be felt seriously, they may be seen gathering into groups for conversation, or stretching themselves out in the shade of their trees and houses for repose. The females seem to be more regularly employed, and most of them add to the very simple routine of their domestic duties an almost uninterrupted knitting of thread lace. A number of the men own little plots of ground occupied by their hut and a few cocoa-nut-trees; others rent their tenements of a reserved proprietor, at two milreis per month."

plantations. This district is comprised in the comarcas of Brejo, Garanhuns, Flores, and Boa Vista: in the comarca of Brejo the most valuable quality of Brazil cotton is produced; yet the distance, fifty leagues, by land from the Recife, the port of shipment, occasions a serious expense. The products of these districts—cotton, hides, &c.—are carried to the Recife on horses: each animal laden with two bags of cotton, weighing four to five arrobas, or 150 lbs. each bag; hides and other articles in proportionate weight; the valleys in the other comarcas of the *sertao* are very fertile; Enci is the most distant, being 180 leagues west-north-west from the Recife. This extensive district is, in general, visited septennially by drought, the earth is then parched up, the rivers and the streams are dry, and sustenance for man or beast is with difficulty obtained.

The sudden change of temperature common in other climates, is rare in Pernambuco, especially during the summer months, at which period the weather is delightful:—in the rainy season, some days occur when the atmosphere is charged with haze and mist, rendering the sun invisible: some minutes before the rain falls the clouds descend, thick and black; the air is oppressively close, the heaving of the sea is suspended, and a gloomy calmness prevails,—sure prognostics of the approaching rain, which shortly pours down in torrents, refreshing the parched earth, and fertilizing the soil.

The provincial government has for the last seven years, effected improvements of the principal roads to the interior; opening one to San Antonio, and the neighbouring towns south-west, is proceeding rapidly. On this road, a long and high suspension bridge has been constructed across the valley of a turbulent river; the first bridge of the kind in the empire. The roads and bridges to the southward comarcas, are also attended to, and considerable sums were expended in their repairs; various improvements are also taking place in the city of Pernambuco, not only in adorning it, but also rendering it more salubrious; a company has been formed to convey purer water into it than the inhabitants have been accustomed to drink, by underground pipes, from an exhaustless spring at Ipopucas, seven miles distant, and introduced into every quarter of the city. In various parts, fountains are to be erected for general use and public ornament, and it is in contemplation to supply each dwelling with water by means of pipes. This city is now enabled to maintain its rank in the empire, as the third of importance, and as the capital of a province so fertile and magnificent as Pernambuco: the products of which exported during the last five years, viz., 1840 to the end of 1844, through the Recife, were,—

Sugar to foreign ports, average each year	tons.
To ports in Brazil	30,068
	4,109
Total	34,177

The exports of cotton to foreign ports, averaged 32,279 bags, of about

160 lbs. each; and that of hides, the average number, exported from the province, was 72,500.

There are, however, drawbacks on the progress of agricultural industry in this province. In the interior, the spirit and influence of practices of feudal origin prevail; private animosities, aggravated by political feelings, enrage families, until vengeance is satiated by the *removal* of the offending party. Even in the towns these diabolical passions occasion strife and wickedness.

The following interesting account of the sugar plantations or *engenhos* of Pernambuco was, in 1846, furnished to the British consul by M. A. de Mornay, a gentleman, who, from his occupation as a civil engineer, has frequent opportunities of observation:—

“In the province of Pernambuco, the sugar *engenhos* are situated almost altogether along the coast; and one is surprised in travelling through the country to find such a complete chain of them, not only along the main roads, or rather tracks, but along numberless cross-tracks, which cut the land in all directions, and extend as far as twenty or thirty miles inland. Immediately behind the land occupied by the *engenhos*, is a strip of land, varying very much in width, averaging about ten leagues, or thirty miles. The soil is similar to that of the sugar districts, and it is covered with a luxuriant forest of fine timber trees. Behind this again, is the country called the *Sertao*, or *Catinga*, where the cotton is grown, and which supplies all the cattle and horses for the use of the *engenhos*, and for general consumption along the coasts. There are, however, but two natural divisions in the soil and climate of the province. The land which lies along the coast, together with the forest land, forms one division; and the other is the *Sertao*, which comprises the whole of the interior. The soil of the former is a rich clay, or fine loam, exceedingly fertile, abounding in small rivulets and springs, and refreshed with rain at intervals during the dry season, and where it has not been cut away for cultivation, densely covered with wood. The soil of the latter is compact and sandy, and the climate very dry, the trees appear stunted, and are very thinly scattered over the ground; it is, however, very productive after the heavy rains of winter have fallen.

“The *Sertanejos* chiefly plant Indian corn, and a kind of kidney bean, which form their principal food. It sometimes happens in the *sertao* that a winter passes without rain falling, and sometimes two or three dry years follow each other, in which case the inhabitants suffer greatly from hunger and thirst, and whole families die of starvation, and sometimes in procuring food in the wood, they die of eating some poisonous root, and this is not of unfrequent occurrence. These *seccas* are said to occur once in about ten years. The rivers always dry up in the summer, and for water during that season they depend upon the rains of winter, which are collected in large artificial ponds; or, if in the neighbourhood of a considerable river, they dig wells in the dry bed. The population may be said to

be divided into two distinct bodies, and the distinction is not made between the white and black, but between the slave population and the free; very little distinction being made on account of colour. The reason probably is, that there are few families who are not tainted more or less with a mixture of negro blood. The free population of the sugar district is divided into three classes, the *Senhor d'Engenho*, the *Lavrador*, and the *Morador*. The *Senhor d'Engenho* is the owner of the land, the mill, &c., and he is also the sugar manufacturer; he plants the chief part of the cane himself, but as he can always make more sugar than his own plantations will produce, he invites agriculturists who have a few slaves, to live on the lands of the *engenho*, for the purpose of planting cane, to be ground at the mill, and made into sugar, half of which is delivered over to the *Lavrador*, the other being kept as his own share. There are also *Senhores d'Engenho* who do not possess the land; they erect the dwelling-house, mill, &c., and work the land for a certain number of years, generally eight to twelve; at the end of that time all the buildings, works, &c., belong to the owner of the land, and they are considered sufficiently remunerated for the use of the soil. The *Lavrador* is the cane planter who lives on the land of the *Senhor d'Engenho*, land and house-rent free. As well as cane, he is allowed to plant mandioca, and any thing for his own consumption. He delivers his cane at the mill, and there receives his moiety of the sugar. That of *Lavrador* is considered quite a gentlemanly employment, and men of good family, who do not possess, or who have not the means of working an *engenho*, think it no degradation to follow it. There are, however, *Lavradores* of all grades, in colour and respectability; some plant very extensively their plantations, producing as much as fifty tons of sugar yearly, while those of others will produce no more than one or two tons.

"The *Morador* is a kind of tenant at will, he also pays no rent, but builds his own hut or shed. Both the *Lavrador* and the *Morador* are so far dependent on the *Senhor d'Engenho*, that in the elections they are completely controlled by him; but on those estates where the owner has some government appointment (generally in the police), or has acquired a power independent of the government, by allowing to live on his estates, and protecting assassins and other bad characters. The *Morador*, if one of these protected criminals, is completely in the power of the *Senhor d'Engenho*, and ready to obey him in every thing, even in the commission of the most atrocious crime.

"The social condition of the population in the sugar district is very peculiar, for with a very liberal constitution, its actual state makes it appear to be governed on the feudal system. With all the machinery of the law apparently in force, it is in reality very little respected by the majority, the lower orders only fearing the *Senhor d'Engenho* on whose estate they live, and the *Senhor d'Engenho* only fearing one more powerful than himself. It is usual for a man after

committing a murder to go to a *Senhor d'Engenho* and beg his protection, and unless he has private reasons for not doing so, he is always ready to *padrinhar*, '*godfather*' the criminal, thus adding to his power.

"A rough estimate of the number of *engenhos* in the province gives about 600, and they occupy about an equal number of square leagues, or one square league each *engenho*. One square league of land is ample for four *engenhos*, so that this belt of land now occupied by sugar establishments, is capable of receiving four times its present number, and if the whole of the land suitable to the growth of cane were put under cultivation, eight times the number might very well exist. Each *engenho* produces on an average fifty-five cases of clayed sugar annually, fifty of white, and five of brown, or *moscavado*, which are equal to forty-two tons of white, and four and one quarter tons of brown, or 24,800 tons of white, and 2550 tons of brown, for the entire produce of the province (this is a very low estimate). Each *engenho*, with sufficient hands, and with their present rude mode of cultivation, might produce at the very least, thrice as much as at present, and if the whole of the land suitable to the growth of the sugar-cane were put under cultivation, the province would yield sixteen times what it does at present, or 396,800 tons of white, and 40,800 tons of *moscavado*.

"The number of slaves is various on different *engenhos*, but the average may be taken at thirty for field blacks, and ten for house and other blacks, and the average number of blacks belonging to the *Lavradores* about twelve, making fifty-two, the average number on each *engenho*, or 31,200 for the entire black population in the sugar district, not including those in the capital or villages. To work an *engenho* effectively near the capital, forty slaves are considered a fair number, but far in the country, if the land be well wooded, twenty-five blacks will produce an equal effect, on account of the facility of procuring fuel and wood for fencing, and the land being more productive. There are *engenhos* in the virgin forests with as few as fifteen field blacks, and even less; the soil there is so exceedingly productive, hence the possibility of working an *engenho* with so few hands. There are some few *engenhos* with as many as 150 slaves, but the quantity of sugar they make is not in proportion to the number of hands, they are, however, kept in much better order, and the slaves are in much better condition. The greater number of *engenhos* are very deficient in slaves, and the consequence is, that much work, not of immediate necessity for the production of a large quantity of sugar, is left undone, or very badly done, or else the slaves are very much over-worked. There is a spirit of emulation among the *Senhores d'Engenho* to make a large quantity of sugar with a small number of blacks, but instead of accomplishing this by the economisation of labour and good management, it is generally done by driving the slaves at their work to the very extent of their strength, and even beyond it. This forced work they cannot resist many

years; they become thin and languid, their skin dry and scurvy, and of a dark slate colour, instead of the polished black of a healthy negro; and in those engenhos where the slaves are in this state, there are always several who have what is called the 'vicio,' or vice of eating earth. It is a generally received opinion that this vice or desire to eat earth is wilful on the part of the slave, and persisted in, in spite of severe floggings, for the purpose of putting an end to his already nearly worn-out existence; it is, however, more probably the consequence of a state of health brought on by over-work, bad food, and general ill-treatment; the appearance of a slave who eats earth is a yellow skin, a white fur on the tongue, and a dropsical appearance, particularly about the eyes; and the vice of eating earth is the effect and not the cause of the disease; this disease is not confined altogether to the slave population, free children among the poorer class are frequently met with, suffering from the same malady.

"A child who eats earth is considered a reproach to his family, and he is said to be instigated by the devil, all possible means are tried to prevent his getting at any earthy substance, but all their care avails nothing, he continues in the same state, the devil, as they say, always finding means to supply him, he will sometimes eat the earthen water-jars.

"The hours of field labour during the season that the engenhos are not at work, are from six in the morning until six at night, and at most engenhos they give them work about the establishment before that hour in the morning and after it at night, this work they call 'kinginggoo;' the length of the 'kinginggoo' varies according to the disposition of the master, it very commonly continues from four to six in the morning, and from six to ten at night, and on some occasions until midnight; during the season of the crop, which lasts from September to February or March, besides their usual day labour, from six in the morning until six in the evening, they are divided into two gangs to work in the mill during the night, one gang working from six until midnight, and the other from midnight until six in the morning; half an hour is allowed them in the morning for breakfast, and two hours in the middle of the day to take rest and food, except during the months of grinding, when they take their food how they best can. Their work at this season is very hard, and it is common to see them alternately sleeping and waking, without interfering with their occupations; the boys in the 'manjara' (a seat behind the horses of a cattle mill), fearing to be observed, get into the habit of sleeping for a second of time only, and of rousing themselves sufficiently to whip the horses, when they have another nap no longer than the first; the black who carries away the cane trash from the mill, may often be observed taking a similar nap in the act of stooping to join the ends of the cane leaves round his bundle: and it appears that they derive rest from these continual momentary snatches of sleep during their night's labour. Some masters allow the Sundays, and one or two holidays in the year; but during the time of

sugar-making very few allow them Sunday. The blacks are generally insufficiently clothed; the men are allowed every year a pair of coarse cotton drawers, a shirt, and generally a hat also, and a piece of red baize to cover themselves at night; the women have a similar allowance: their food consists of two pounds of dried beef, called 'carne de siera,' per week, and a measure of farinha de mandioca every day, in quantity being about as much as would fill a wine-bottle; the dried beef is very salt, and comes from Rio Grande do Sul. The general mode of cooking it is, by throwing it on the hot embers until it is burnt outside; this is often the only food of the slave during the whole year, except, perhaps, fresh beef on Christmas Day; the food is sometimes varied by giving them salted cod-fish; to this sameness of salt food, added to hard work, may be attributed many of the bad diseases of the skin, to which they are subject; a slight scratch, particularly in the legs and feet, often turns into the most obstinate sore. On those engenhos, where the slaves are not over-worked, a number of Creoles will be seen, and the general appearance of the blacks, healthy and cheerful, while on the other the young blacks are all of new importation, and a considerable portion of the profits of the owner must go yearly in purchasing slaves to supply the place of those who die. When they are very well treated, the stock is kept up by those bred upon the estate. If there were not, however, a constant supply from the coast of Africa, the slave population would rapidly diminish, and many sugar engenhos, in a very few years, would be unable to continue their operations. Many Senhors d'Engenho already find their 'fabricas' decreasing yearly on account of the difficulty of procuring, and consequent high price of new blacks. A strong healthy field black is now worth as much as 60*l.* or 70*l.* sterling: before the slave treaty he could be bought for 25*l.* sterling.

"In a general view of the agriculture of this province it will be seen that nature is very little assisted in her labour; in Pernambuco it is true that the earth is tilled, planted, and cleared upon the best estates in an efficient manner, but the choice of lands and the change of crops, manuring, the formation of roads and bridges from the plantations to the mills, are very little attended to. In Alagoas this is in a still more backward state; ploughs, and other European implements of husbandry are unknown there, and indeed they are not much used in Pernambuco; I have only seen one plough in operation, notwithstanding that the tillage of the ground would be no less benefited here by their use than that of Europe; the hoe is the favourite agricultural implement: in planting, it is the spade and plough, in cleaning, the rake and harrow, and cotton, sugar, mandioca, maize, and all the other productions owe their existence to it."

Pasturage is in its wild state, and confined chiefly to the "catinga," where the grass grows spontaneously; in the *matto* and *costa*, grass is grown from seed, but scarcely for pasture, as the cattle are not allowed to graze upon it, but cut, and then carried for food to cattle-sheds and stables; the cattle of the poorer

classes, in the wooded country and along the shores, are excluded from the Capim da Planta, or sown grass, by fences, and find very precarious sustenance; little attention is paid to the breeding of cattle in respect of crossing and improving the stock, the horses are chiefly Spanish barbs turned out with the mares to graze in the "catinga," almost in a wild state; the colts of this breed are worked young, and often fed on "caxaça," or sugar skimmings, and molasses, by which they soon lose their teeth, and then become nearly unfit for service. They are usually about twelve hands high, and are rather showy little horses. The horned cattle yield beef of good quality during the rainy season; but after drought it is of an inferior description. The milch cows, as such, are of little value, at least upon the coast; the sheep are long-legged, with hair rather than wool, but the mutton is considered excellent.

The manufactures of the province are almost entirely domestic or family work. In the Sertao the leather dresses of the Sertanejas, "redes," or hammocks, and a coarse, but not ugly, sort of cotton cloth is made, never dyed. This cloth resembles the shepherds' plaid of Scotland and the north of England, and is used for trowsers. In the Matto those knives are manufactured, which are carried by every one, and used indifferently for all purposes, from eating their dinners to stabbing their neighbours. On the coast, lace is made of several descriptions; the most general is not unlike *point lace*, and considering the time occupied in its production, it is sold at a low price. A pretty work, too, peculiar to Brazil is also manufactured upon the coast, namely, "Lavarinha." Coarse cotton bags for sugar are also made at almost all the engenhos, in the houses of the poor: there is no large manufacturing establishment in this part of Brazil, except an English iron foundry in the capital, and two other English ones in progress.

PERNAMBUCO, or, as this city is more commonly called in the country, the *Recife*, or the Reef, is situated close to the Atlantic coast, in 8 deg. 6 min. south latitude, and 35 deg. 1 min. west longitude. Its free population, including the suburbs, is stated by the British consul, in 1845, to amount to 74,310 inhabitants, and the adjoining town of Olinda has 17,824, so that the total number of free inhabitants in these towns, exclusive of slaves, is 92,134, among whom are enumerated 160 French, 125 English, and 300 Germans, including 200 German labourers, who arrived under contract for the service of the provincial government. Of United States' citizens, the numbers seldom exceed ten or twelve.

The city of Pernambuco and its suburbs are divided into three parishes; within the town are those of San Pedro de Gonsalves, or Recife, San Antonio, and Boa Vista. These three contain seventeen churches, and also a British chapel; two monasteries, three recolhimentos, or asylums for girls, six hospitals (public and private), a theatre, a government palace, custom-house, prison, marine and military arsenals, and three suits of barracks for troops. Its institutions for public instruction are a lyceum, two Latin, and seven primary schools. It has

three printing-presses, publishing two daily newspapers and three other periodicals, besides occasional volumes of books. Its streets are paved in part, and illuminated by 360 lamps. Four old fortresses—the Picão, on the extremity of the reef; the Brum and the Buracco, on the sandy shore towards Olinda; and Cinco Pontas, or the Pentagon, on the southern front of the city.

The appearance of Pernambuco, when seen from the water is peculiar; its site is flat, and but little elevated above the level of the sea. The white high buildings erected on the praya, seem to rise from the ocean. Inseparable from this view of Pernambuco is that of Olinda, on a bold and picturesque hill two miles north. Its natural appearance caused Duarte Coelho as he arrived on the coast in 1530, to exclaim, “*O linda situação para se funda uma villa!*”—“O beautiful site for a town!” His exclamation was immortalised by being used, in part, to furnish a name.

Olinda continued the capital of the province for about 200 years; but, at length, owing to its situation not being favourable for commerce, from being too far from the Recife, which forms the only harbour near; a town gradually arose up near the Recife, by which name it was called. Mr. Kidder says—

“Many of the houses of Pernambuco are built in a style unknown in other parts of Brazil. That occupied by Mr. Ray, United States’ consul, stood fronting the water-side. Its description may serve as a specimen of the style referred to. It was six stories high. The first, or ground-floor, was denominated the *armazem*, and was occupied by male-servants at night; the second furnished apartments for the counting-room, consulate, &c.; the third and fourth for parlours and lodging-rooms; the fifth for dining-rooms; and the sixth for a kitchen. Readers of domestic habits, will perceive that one special advantage of having a kitchen located in the attic, arises from the upward tendency of the smoke and effluvia universally produced by culinary operations. A disadvantage, however, inseparable from the arrangement, is the necessity of conveying various heavy articles up so many flights of stairs. Water might be mentioned for example, which, in the absence of all mechanical contrivances for such an object, was carried up on the heads of negroes. Surmounting the sixth story, and constituting in one sense the seventh, was a splendid observatory, glazed above and on all sides.

“The prospect from this observatory was extended and interesting in the extreme. It was just such a place as the stranger should always seek in order to receive correct impressions of the locality and environs of the city. His gaze from such an elevation will not fail to rest with interest upon the broad bay of Pernambuco, stretching with a moderate, but regular incurvation of the coast, between the promontory of Olinda and Cape St. Augustine, thirty miles below. This bay is generally adorned with a great number of *jangadas*, which, with their broad latine sails, make no mean appearance. Besides the commerce of the port itself, vessels often appear in the offing bound on distant voyages, both north and south. No port is more easy of access. A vessel bound to either the Indian or the Pacific Ocean, or on her passage homeward to either the United States or Europe, may, with but a slight deviation from her best course, put into Pernambuco. She may come to an anchor in the Lameirão, or outer harbour, and hold communication with the shore, either to obtain advices or refreshments, and resume her voyage at pleasure, without becoming subject to port charges. This is very convenient for whaling ships and South Sea traders, which accordingly make this port a great rendezvous. In order to discharge or receive their cargoes, they are required to come within the reef, conform to usual port regulations.”

Ships of war seldom remain long here. None of large draught can pass the

bar, and those that can are required to deposit their powder at the fort. The strong winds, and heavy roll of the sea, are frequently sufficient to part the strongest cables. The commercial shipping is under full view from the observatory, yet it is too near at hand, and too densely crowded together, to make an imposing appearance.

OLINDA, built upon a hill, has white houses and massive churches with luxuriant foliage interspersed amongst them, in which those edifices on the hill-side seem to be partially buried. From this point a line of highlands sweeps inward, terminating at Cape St. Augustine, and forming a semicircular *reconcave*, analogous to that of Bahia. The summit of the highlands is crowned with green forests and foliage.

"Indeed," says Mr. Kidder, "from the outermost range of vision to the very precincts of the city, throughout the extended plain, circumscribed by five-sixths of the imagined arc, scarcely an opening appears to the eye, although, in fact, the country overlooked is populous and cultivated. Numbers of buildings also, within the suburbs of the city, are overtowered, and wholly or partially hid by lofty palms, mangueiras, cajueiros, and other trees. The interval between Recife and Olinda is in striking contrast to this appearance. It is a perfectly barren bank of sand, a narrow beach, upon one side of which the ocean breaks, while, on the other side, only a few rods distant and nearly parallel, runs a branch of the Beberibe River. This stream is navigable to boats as far as Olinda, and forms the principal channel of communication with that place, although the beach may be considered a species of turnpike."

At a distance of from one-fourth to half a mile from the shore is the bank of rocks already mentioned as extending along a great extent of the northern coast of Brazil. Its top is scarcely visible at high water, being then covered with a surf which dashes over it. At low water it is left dry, like an artificial wall, with a surface sufficiently even to form a promenade rising out of the sea. It is from two to five rods in breadth. Its edges are a little worn and fractured, but both its sides are perpendicular to a great depth. The rock, in its external appearance, is of a dark brown colour. When broken, it is found to be composed of a very hard species of yellow sandstone, in which numerous bivalves are embedded in a state of complete preservation. At several points deep winding fissures extend through a portion of the reef, but in general its appearance is regular, much more so, than any artificial wall would be after exposure for ages to the surges of the ocean.

Opposite the northern end of the town, as though a breach had been artificially cut, there is through this reef a channel of sufficient depth and width to admit ships of sixteen feet draught, at high water.

Close to this opening, on the extremity of the reef, stands the fort, built by the Dutch. Its foundations were admirably laid, being composed of long blocks of stone imported from Europe, hewed square. They were laid lengthwise to the sea, and then bound together by iron. A wall of the same origin extends from the base of the fortification to the body of the reef.

The district of San Pedro is not large. Its buildings are chiefly in the old Dutch style of architecture, and many of them retain their latticed balconies or *gelouzas*.

The principal street of the Recife is Rua da Cruz. At its northern extremity, towards the Arsenal da Marinha, it is wide, and imposing in its aspect. Towards the other end it is narrow, and flanked by high houses, like most of the streets by which it is intersected. A single bridge connects this part of the city with San Antonio, the middle district. This bridge across the Beberibe is more modern than the one having a row of shops on either side. That having been broken down in the revolution of 1824, was rebuilt in a different style. It has no covering, but is flanked on either side, and in the middle, by rows of seats, which furnish a favourite resting-place to throngs of persons who walk out in the evenings to enjoy the cool air and refreshing sea-breeze. On the side towards the sea vessels anchor near to it, though they do not pass above this bridge. At either end stands an archway, built of brick. These arches are disconnected with the bridge, although they span the street leading to and from it. The principal object of their construction seems to have been to furnish a prominent place for shrines and images. These arches survived the destruction of the old bridge, on account of the religious purposes to which they are devoted.

In the San Antonio quarter of Pernambuco are the palace and military arsenal, in front of which a wall has been extended along the river's bank. Above the water's edge there is a row of green-painted seats, for the accommodation of the public.

The principal streets of this quarter, with an open square used as a market-place, are spacious. The bridge crossing the other river is long, although the stream beneath is shallow. On the southern or south-western bank of this river stands the British chapel, in a very convenient place. Boa Vista is chiefly occupied by private residences and country seats. A few large buildings stand near the river, and, like most of those in the other sections of the town, are devoted in part to commercial purposes. Beyond these, the houses are generally low, and are surrounded by gardens or *sítios*. The streets are unpaved, and in a most wretched condition, and many of the streets and lanes in the suburbs are filthy.*

TRADE OF PERNAMBUCO.

Butter and other manufactured goods have been, but not altogether, supplied

* The hedges in the environs of Pernambuco are similar to those at Rio, although generally more rank in growth. Many of the houses exhibit an expensive, and at the same time tasteful, style of construction. I was pointed to one, in the veranda of which was arranged a collection of statues. The owner being a wealthy and notorious slave-dealer, some wag, a few years since, thinking either to oblige or to vex him, crept in by night and supplied him with a cargo of new negroes, by painting all the marble faces black.

Magdalena, on the left of Boa Vista, is another favourite section of the town. A stone bridge across the river leads into it.

by Great Britain; latterly the woven cotton cloth called "*domestics*" has been introduced from the United States, particularly for the African market. The American cloths of this kind are stouter and heavier than those of English manufacture, more equable in length and breadth, each piece thirty yards in length, and of the width of twenty-seven to twenty-eight inches. These "*domestics*" sell also for better prices than the English; but the manufacturers of Lancashire are making an imitation of these "*domestics*," the imports of which have been successful.

In printed cottons those of Manchester and Glasgow remain unrivalled, except in printed muslins, in supplying which the Swiss are successful competitors. In linens those of Scotland and Ireland command a preference, although the few imported from Portugal are always in demand. In the finer descriptions of woollens, the French are profitably increasing their imports.

Salted cod-fish, from Newfoundland and Nova Scotia, is almost exclusively in the hands of the English. A chance foreign vessel may arrive on speculation, which is not injurious to those colonies, as the parties either purchase the fish, or take it in barter for other commodities. This trade forms a considerable item in the British commerce with Pernambuco: of eighty-eight English vessels which arrived and discharged in this port in 1844, twenty-six vessels were from the North American colonies. The French have introduced one cargo from the island of St. Pierre on the coast of Newfoundland; yet with the bounty allowed by their government of twelve francs for each barrel of two quintals, it sold at a loss to the owners; their fish is too large and fat to be sufficiently cured and prepared for the climate of Brazil.

Tea has been principally supplied from the United States.

Butter.—The French have been within the last few years augmenting their importation of this article. In 1840, they introduced 4160½ firkins; 1841, 5549; 1842, 5066; 1843, 7981; and in 1844, 8962 firkins; the English imported during the same years, viz., in 1840, 4437 firkins; in 1841, 3889; in 1842, 3249; in 1843, 4022; and in 1844, 3616 firkins. The quality of the French is considered much inferior to the Irish butter, and sells at lower rates.

Earthenware and Glass.—The former is chiefly from England. Some coarse ware is imported from Oporto and Hamburg. The German common glass is much used from its cheapness.

Soap is now manufactured to a very considerable extent in Rio de Janeiro, Bahia, and this city, but the quality is much inferior to the foreign.

Hats.—The German manufacturers in this city supply a cheap article which is injurious to the import of common hats, with the exception of the *Braga* hats, from Portugal, which are always in demand; the finer qualities from England and France are only worn by the higher classes and foreigners.

Flour.—That of the finer kind imported from Trieste, is eagerly sought for by the bakers, to mix with that from the United States, which, together, make superior bread.

Iron, bar and rod, iron-work and hardware, iron boilers and pans for the sugar engenhos, are all in considerable demand; the latter from England, excepting some inferior kind of hardware from the continent. The English iron is, however, favoured in the import duty, paying 1 rial 250 dollars per quintal, and Swedish pays 1 rial 750 dollars per quintal, a difference in favour of the former of 500 rials, or 1s. 0 $\frac{3}{4}$ d. per quintal.

Messrs. Starr and Co.'s works for the manufacture of steam-engines, machinery, &c., are extensive, and prosperous; two other English establishments of a similar description have been lately formed, with favourable prospects.

A quantity of produce is sent to foreign ports from Maceio, Parahiba, Aracati, and Ceara, on account of merchants in Pernambuco, and received in payment for commodities sold to the shopkeepers and others in the interior.

In this province many circumstances have tended strongly to check its prosperity; the great depreciation in the currency,—the baneful effects of the slave-trade, in draining the province of the precious metals; the great diminution in the produce of cotton, formerly its staple article of export, all operate against its prosperity.

The produce of sugar has, however, rapidly increased, viz., 1828 to 1831, the average annual export was 1,607,389 arrobas, and in the four years 1841 to 1844, the same was augmented to 2,083,212 arrobas annually, an increase of 475,823 arrobas annually, or, 6797 $\frac{33}{72}$ tons. The number of hides exported during the two periods of the preceding mentioned four years, has augmented in a yet greater ratio than sugar: in the four years, 1828 to 1831, the annual average export was 60,272 hides, and in the latter four years of 1841 to 1844 inclusive, the same average has increased to 122,573 hides per annum, showing a surplus of 62,301 hides.

A new article of export has lately attracted much attention, the *carnauba wax*, obtained from the leaves of a peculiar species of the palmatto. In the sertão of the province, and the provinces of Ceara and Piahy, are immense forests of this tree, which can provide an inexhaustible supply, should it be found suitable for the English market. The inhabitants of the districts where this palm grows, during the dry season of the year, beat from the leaves a white powder, which, being carefully collected, is boiled in water to the state of consistency forming the wax. Many small quantities have been sent to Liverpool as an experiment. In the manufacture of composition candles and other articles it forms a principal ingredient. The candles made entirely from this vegetable wax in the sertão, are said to emit an agreeable perfume whilst burning. Bees'-wax has latterly been attended to, and the management of bees better understood.

The feeding of the silkworm has recently become a subject of interest. These products, if capable of being encouraged and fostered, would add considerably to the advancement of this province.

Were the imperial government in a position, with reference to its finances, entirely to remit, or even to modify the export duty levied upon the produce of the Brazils transmitted to foreign ports, it would confer an invaluable boon upon the agriculturists. This duty is ten per cent upon a weekly average valuation of sugar; twelve per cent upon cotton, coffee, and tobacco, and seven per cent upon rum, hides, and all other articles. The cotton districts require this relief perhaps more than any other, as the planters are obliged to incur very heavy expense in bringing their cotton, by horse conveyance, a distance varying from twenty to 100 leagues, to the Recife, during the dry seasons, when food and fodder for man and beast are difficult to obtain: the obstructions and charges are augmented, leaving him, the planter, for the fruits of his labour and industry, a sum little more than $1\frac{3}{4}d.$ to $2\frac{1}{2}d.$ per lb.

RETURN of British and Foreign Trade within the Consulate of Pernambuco, during the Year ending the 31st of December, 1845.

DESCRIPTION.	ARRIVED.				DEPARTED.				REMARKS.

The SMALL PROVINCE of ALAGOAS, was formerly included within the limits of Pernambuco, but was cut off from the latter, in order to reduce the province of the Pernambuccans, of whose independent spirit Rio de Janeiro has been always jealous. Alagoas derives its name from the lagoon, on which stood its old capital. The coast is very flat, with sandy beaches interrupted by red clay cliffs, eighty to ninety feet high. Maceio, the capital, is fifty-two leagues to the south of Pernambuco. Mr. Cowper, the British consul at the latter place, who visited Maceio, in January, 1846, says, the town is well-built, and contains about 5000 inhabitants; and that the port is sufficiently extensive. The trade of this place consisted, in 1845, in exporting produce, to the value of about 112,000*l.* sterling, exclusive of Brazil-wood (of which the crown has a monopoly), to the estimated value of about 12,000*l.* sterling. The direct European imports of manufactured goods, amounted in value to 8250*l.* sterling (all from Great Britain); and of the exports, the value of about 95,000*l.* sterling was exported in British vessels: twenty-five British vessels entered the port, and five belonging to other countries. A revolution had previously broken out in the province; but it was suppressed, but not until the place was sacked by the party called the *Sisos*, or *Smoothers*, who were then established in Para; the president of which has put down the press. The mere legislation of the province is considered a farce. Immense quantities of oysters abound in the lake of Alagoas, and constitute a cheap article of food. Some parts are very deep, but generally the water is shallow. The lands around the lake is devoted to the cultivation of sugar, with here and there a small town, or *povoações*; the chief of these are Villa de Norte, Cocoa Seco, and Pedreiro; and the principal *engenhos*, Carapina and Pinto. The country is undulating, and the soil of that peculiar dark colour, said to be the best adapted for the growth of sugar; but the *engenhos* of Alagoas are very inferior to those of Pernambuco; filth and poverty seem stamped on their walls, and idleness and neglect upon their fields. Some *engenhos* have no more than six slaves, and make only four or five cases of sugar annually. Many of the sugar baking-houses are described by Mr. Cowper as merely thatched sheds; and the mill power is either water or cattle, never steam. Owing to the drought, he found the majority of the water-*engenhos* stopped; at this part, however, the *mundahû* enabled them to work. The condition of the people is worse in this province than in Pernambuco, even near Maceio their huts were altogether built of cocoa-nut leaves—a rare circumstance in Pernambuco; but they appeared, however, to be tolerably supplied with the mere necessities of life.

“Passing,” says Mr. Cowper, “the villages of Corto Latoubã, and the *Engenho Gassatorte*, we ascended to the *tabolleira*, or table-land, and here the whole face of the country altered, it is about three long leagues in extent, and appears to be the barrier at this part between the coast and the *matto*, or forest.”

He divides these provinces into three natural districts :—the costa, or coast; the matto, or forest; and the sertão, or highlands. The barren taballeira appears to divide the first from the second; cactacea, and other desert weed-plants, are scantily spread over it; the soil is sandy, on which no water rests, and the few trees that are met with are stunted, the whole appearance of the taballeira is deserted and wild: it has no inhabitants. At its extremity he passed a village called Boca da Matta, or Mouth of the Forest; here the soil changed to a rich light loam of a deep red colour, with large timber-trees. Mr. Cowper says, "The race of men visibly changed too; upon the coast we had seen the black, the white, and their varieties, forming a mongrel race, morally and physically degenerate,—but on the side of the taballeira upon which we now found ourselves, the matto, the human species at once improved, few varieties were to be seen; they were almost universally mulattoes, which, indeed, they call themselves; it is probable that an admixture of Indian blood may have produced this change, for it appears that human exotics improve by being grafted upon the indigenous race; the mamalukas, or female offspring of the white and Indian, are universally considered the most beautiful women in Brazil; and I have no doubt that the superior physical appearance of the people of the matto to those of the coast, is the cross between the negro and the Indian. Two leagues from Boca da Matta, we arrived at Atalaia, a town, originally belonging to the Indians, situated upon the Mundahû River, and containing about 1500 inhabitants; it is now in a miserable condition; it was the point at which most of the encounters between the government troops and the rebels, during the last insurrection, took place: this commenced what the drought has accomplished, the utter ruin of Atalaia. It is long since the Indians possessed it; they were driven out by the Portuguese, who raised it to considerable importance in a commercial point of view; it became the emporium for the productions of Europe for supplying the interior, and they there received the cotton and cattle forwarded thence for the coast; until very lately it remained in this state; the population being almost wholly white, but the brutality of the soldiers, sent to quell the rebellion, to the women, drove the Portuguese to the coast, and Atalaia has sunk into a receptacle for fugitive thieves and slaves; the insurrection cost the province 900 contos, or 90,000/."

He passed the Engenho Cagado, upon the Mundahû, which was here quite dry, and reached the commercially unimportant town of Capella, on the Parahiba River, which the drought had dried up. Cotton, produced in this neighbourhood, is forwarded to Maceio on horseback. Here he met some of the wretched emigrants from the sertão, driven towards the coast by the famine produced by the want of rain; they looked like living skeletons. Leaving the next village, Costa, he entered the beautiful valley of Gamellera, at the foot of the Serra dos

dois Timãos. He says, "Highly picturesque mountains, several thousand feet above the level of the sea, and actually one thousand from the valley, are at its end; betwixt them the Parahiba falls over rocks, hollowed into caves, and rushes through the town, which is pleasing, and contains about 500 or 600 inhabitants. The hills upon each side are covered to their summits by palm-trees, in the most exquisite state of perfection; from these the people extract oil, and in the lower parts of the valley plant cotton." He was several hours crossing the serra, which is the boundary betwixt the matto and the sertão, and about twenty-six leagues from Maceio due west, and then reached Assemblia, the first Sertaneja town.

He then informs us, "In the sertão all is again changed—the face of the country, the race of men, and their habits. The negro and his varieties are almost entirely lost, for very few slaves ever enter the sertão; the roots of this species (the sertão inhabitants) are the white and the Indian, the former predominating; the women are very beautiful, feminine in their manners, and soft and gentle in their voices, forming a strong contrast with their fellow-countrywomen of the coast; with considerable natural modesty too, they have none of the *gaucherie* of the latter, and their hospitality and kindness knows no bounds. The men are a fine, open-hearted, active set of fellows, devoted to their herds, which they tend on horseback; they are unrivalled horsemen: their dress is peculiar, and unlike any thing I have seen in other countries, it is entirely composed of leather; the hat is broad-brimmed and low-crowned; the guarda peita, or waistcoat, is slung round the neck, and has no back; the tibão, or jacket, usually worn slung over one shoulder, like the hussar pelisse; the trousers in two pieces, the legs being separate to enable them to sit their horses with greater ease; then the long espada, or sword, with its silver handle; the faca de ponta, or dagger, silver-hilted and sheathed; the heavy silver spurs, with immense iron rowels; the patrona, or cartouch-box; the flaying knife, or faca grande; and the purse, wove by the women: the accoutrements of the horse too, with its high saddle and ornamented bridled, present a living picture, which it is impossible not to admire. They glory in the name of 'Baqueiro,' and the sons of the richest proprietors join their ranks. From their continued exposure to the sun, there is a marked difference in their colour and that of the women; and it is, perhaps, particularly owing to this wild state of existence, and to their frequent, and to our ideas not justifiable, forages upon the Indians, that we may attribute their practice of taking justice into their own hands."

With reference to the change of soil from the sea-coast inland, he says, "Upon the immediate coast, the soil was flat and sandy; a little inland, muddy alluvium, rising gradually in undulating hills, a rich black loam was the prevailing supersoil, next the light red loam, and hills of increasing altitude, covered with

magnificent timber; but in the sertão, after passing the Dois Timãos, the country is peculiar: it does not present a range of serras, but a multiplication of stupendous isolated mountains, or, at most, short ranges, very often almost impassable; these mountains are excessively rocky, and the singularity in their appearance is, that their superficie is covered by broken pieces of rock, sometimes so regular in form that, where the red limestone prevailed, they resembled heaps of bricks." He collected specimens of a variety of marble, crystals, and stalactites, during that journey. Of that vast portion of the sertão, the *catinga*, or plains between the serras, which is devoted to pasture, he says, "They are most important districts, inasmuch as the whole of the cattle and horses of the country are bred there. Why the term 'catinga' has been applied to it is doubtful, the only known meaning of the word in the Portuguese language, is the peculiar smell which is said to exude from the bodies of dirty blacks. The *catinga* has an excessively barren appearance,—the soil poor, arid, and gravelly; the trees, or rather brushwood, stunted; cactaceæ, of infinite variety, abound; one solitary fruit, the imbu, is produced there, and nowhere else; but most important of all, is the wild grass, or *capim*, which springs up in immense profusion at the slightest rain. Three years of drought, when I passed the *catinga*, had rendered it a desert; indeed, the miserable horned-cattle had instinctively learnt to knock off the thorns of the cactaceæ, and devour their stems; the starving population, or the very few that were left, were eating the fruit of cactus, and that of the imbu. We frequently travelled a whole day without meeting a soul. An intelligent French engineer is of opinion that the *catinga* was once covered with forests, which, having been burnt, destroyed the soil for the purposes of high vegetation. I am of an extremely different opinion, for these reasons:—first, I have never seen large forests on a gravelly soil; secondly, for what purpose could the forests have been destroyed, and so extensively? for the *catinga* not only exists in Pernambuco and Alagoas, but runs in an uninterrupted line from Bahia, and perhaps further south, to Piauhý; and, lastly, there are no remains whatever of large timber, or that rich dark soil and red subsoil which distinguishes the forest lands of this country, produced, I presume, by the decay of vegetable matter. I believe the soil of *catinga* to be virgin; and it is upon this, as I before observed, that all the cattle of the country is bred.

"There are oases to this desert in the shape of well-watered hills; it is upon these spots that the towns of the sertãos are placed, where cotton is produced, and its agriculture flourishes. *Assemblea* was the first of these, it is situated upon the Parahiba River, and had been a place of considerable commerce before the drought; it was now (1846) in a state of dreadful destitution, crowded with refugees from the *catinga*, with farinha at famine prices, and these unfortunates, without

roofs to cover them, were living or dying, or both, in the ditches, with a few leaves placed from bank to bank as a shelter; the Parahiba had ceased to flow, but like all the rivers of this province the bed was rocky, so that it retained portions of water between them in hollows, which the people called 'pocos,' or wells. In the neighbourhood of Assembleia we visited the cotton estate, or 'Fazenda de Algodão,' of Lorenzo." At Lorenzo he first observed the marked distinction between the Senhor do Engenho and the Senhor da Fazenda, "the former is the feudal lord, the sovereign and owner of all upon his property, and he lives in a certain degree of state; the latter great proprietor and planter is still a chief, but neither the sovereign nor owner of his people; he lives very much as they do, and his sons call themselves 'baqueiros,' and act as such, too, in the same manner as the poorest tenant upon the estate; they both have infinite power, the first from the fear inspired by his position; the second, from the affection generally felt for his person. The Senhor do Engenho commands; the Senhor da Fazenda requests, and they are both obeyed. Assembleia contains about 1800 inhabitants; passing from thence through the Matto Oscuro into the Valley of Limoeira, we ascended the Serra de Gravahã, and reached the town of Quebrangula in the evening; it is situated upon the Parahiba, it contains about 2000 permanent residents, but was filled like Assembleia, with emigrants from the upper sertão; it was one of the principal commercial emporiums upon the Parahiba, but owing to the drought is falling rapidly to decay. We slept at a very fine Fazenda de Gado, or cattle estate, about two leagues from Quebrangula, called Gamella, and crossing a mountain called the Serote, the next day passed the small village of Passages, when recrossing the frontiers into Pernambuco, we arrived at the town of Papacaca, beautifully situated amongst the hills, and surrounded with cotton plantations, it is 100 leagues west-south-west from this city, is a new town, and I have no doubt that when the river communication is once more open, it will become an important commercial station, it contains about 1000 inhabitants, whose amiable simplicity and hospitality I shall always gratefully remember.

"Upon the 30th of January we crossed the most formidable mountain which we encountered during the whole journey, called the Serra de Travassada, and entering the catinga, passed the Fazendas de Gado of Trapiar and Salgado; we then crossed in quick succession the Serras of Communati, Ponta, and Panêma; in the latter we rested at the Engenho das Antas, the only sugar estate which we saw in the sertão; indeed, sugar is infinitely scarcer there than in England, we carried our own with us; we passed through the pretty village of Agoas Bellas, and descending the Serra de Panêma, arrived at the town of that name, formerly called the Panema dos Indios, but, alas! that devoted race are driven from there

into the neighbouring *catinga*, where they commit depredations upon the cattle, and are in turn shot wherever met with, as a *baqueiro* said, in my presence, 'Of all the beasts of the field the Indian is the worst, when I meet one I shoot him like a tiger.' *Panêma* contains probably 800 or 1000 inhabitants, and does not appear to be a place of much commercial or agricultural importance—it is surrounded by cattle *fazendas*.

MOXOTO TRIBE.—"From this point we entered a territory infested by Indians, this tribe, called *Moxoto*, is very extensive; they are so far wild that they decline submitting to the Brazilian government; they go quite naked, are armed with bows and arrows, and live by hunting, and, as the whites say, by depredation upon the cattle belonging to them, and by robbery and murder; on the other hand, they occasionally voluntarily seek work in the towns and at the *fazendas*, and are sometimes hunted, caught, and forced to work. When we were there, the inhabitants formed parties to go out and shoot them, asserting that orders had been received from Rio de Janeiro to exterminate them, but I cannot believe that so cruel a mandate could have been issued; as far as our experience goes they are perfectly harmless, we met them repeatedly in the *catinga*, leagues from any habitation; we were two foreigners, with a pair of pistols between us, our watches, chains, &c., visible, and our baggage-horse carrying provisions; they were starving, but they never molested us in the slightest degree."

Leaving *Panêma*, he proceeded across the *catinga* to the *Serra dos Cavallos*, passed the village of *Logrador*, and the *Fazendas* of *Lagumes* and *Caiçara*, in the *serra* of the latter name, crossed the frontier to the province of the *Alagoas*, arrived at *Pilão*, then passed through *Capar*, both insignificant places, then crossed the *Serra de San Francisco*, again into the *catinga*, and through the villages of *Metade* and *Mereceocla*, to the *Serra da Matta Grande*, in the midst of which the town of *Matta Grande* is situated; in the most fertile spot that he had seen since his entry into the *sertão*. It was covered with cotton plantations. *Matta Grande* is well-built: contains not less than 3000 inhabitants: before the drought it was the most important trading place of this part of the *sertão*. It is 128 leagues from *Pernambuco*, and seventy-six from *Maceio*. He travelled onwards to the *Fazenda de Gatto*, and the villages of *Boucheron* and *St. Bento*, in the *catinga*, and ascended the *Serra de Matta Branca*, from the summit of which, on a clear day, the spray of the Falls of *Paulo Affonso* may be seen, fourteen leagues distant; the town of *Matta Branca* is situated amongst hills, which are very fertile, and produce good cotton, which is conveyed to *Piranhas*.

We have in a former chapter introduced Mr. Cowper's account of the River *San Francisco*. He returned by land to *Maceio* from *Penedo*. He informs us that abundant supplies of ship-building wood may be obtained in the neighbour-

hood. In many parts, after leaving Penedo, the country exhibited burning forests, and at different intervals, the conflagration continued until they arrived at Pernambuco, a distance of eighty leagues. This destruction is attributed, in some cases to wantonness, in others to carelessness, but Mr. Cowper believed that the continued drought had rendered the fallen foliage and brushwood so combustible, that it was impossible to guard against their accidental ignition.

From Penedo he passed in succession the hill of Minimba, remarkable for its steep ascent, the village of OsPontes, an extensive *taballeira*, the Engenho Pescoço, the Rivers Conindongo and Xinga, the village of Benguela, and the Engenhos Genepapo and Porção, upon the Cururipe River; at the latter there is good building timber. He then proceeds onwards by the Lagoa de St. Lucia, and the town of that name, the village of Boca da Matta, the Engenhos Tiquia, Prata, Novo, and Caceascomba, and passed the hill of Barra Branca, to the town of San Miguel, which he describes as a rather well-built place, containing about 1500 inhabitants. In its immediate vicinity is the Engenho Tequimbã, from whence to Taparaguã the road for seven leagues is through *virgin* forests, which are so termed in Brazil when they retain *any* trees of the original forest; but, he says, "they are very unlike the noble forests on the Amazon, which have never yielded to man." He passed through Paparaguã, which has about 500 inhabitants: it is a large environ of Alagoas.

ALAGOAS is situated about a mile from it, on a picturesque hill on the borders of the lake, but grass is growing in its streets, and it is falling rapidly to decay; its population is about 3000. He then embarked on the lake, and crossed to Maceio.

Proceeding along the coast, he passed the dangerous quicksands of the Menon River on horseback, the village and river of Pioca, the bar, river, and village of St. Antonio, and some most beautiful cretaceous cliffs, the only break to the monotony of sand-hills which he had seen on the coast of Brazil, they are about 100 feet high, of a blue and white colour, ruptured occasionally into deep, picturesque ravines. At this point he left the coast, and proceeded up the Camaregibe to a bustling little commercial town called the Passo de Camaregibe, with about 1000 inhabitants. Good building timber of various kinds grows in its neighbourhood.

The exportation of timber is, however, prohibited except under special licence from the imperial government, which is not conceded for ship-building timber.

He passed near Camaregibe an engenho worked by freemen. In the same part of the country he says there existed a horrible disease, which he had never before met with, or indeed heard of. It is called "goma;" the sufferer in this case

was the Senhor do Engenho of Vaga da Souza ; it is spoken of mysteriously, as of a curse brought from Africa, of which white men only are the sufferers. It is said to be incurable. The story is that if a white man copulates with an African girl of a certain constitution, sores break out after a certain time, which are difficult to heal, and attack the legs and arms, but they eventually leave the body ; not so the disease, which is sure to appear afresh before death in the shape of "goma," when the flesh by degrees withers from the bones. The consul, however, imagines the whole story to be fabulous, and believes the "bobas" to be nothing more than the common "sarva," to which every one in that country is more or less liable, and that it has nothing whatever to do with the "goma," which has all the appearance and characteristics of leprosy, also a malady with which that country is unfortunately afflicted.

From Camaregibe he reached the Engenhos Canto, Lucena, Matta Redouda, Capitao Dias, Santa Cruz, Prazeres, and reached the town of Porto Calvo upon the Una. It is now a small place with large houses, and a city-like appearance. It suffered much in the rebellions, and contains about 2000 inhabitants. It still carries on some trade, and appears to be gradually recovering its former prosperity. Proceeding onwards he passed the Engenhos Cava de Pao d'Arco, Taparatuba, and Duas Barras, and then recrossed the frontier of Alagoas to the province of Pernambuco. On his journey to the capital, the latter, he passed the Engenhos Paracinha, Savê, and Limoeira, to the prosperous town of Rio Formoso, upon the river of that name. The commander of this town he describes as considerable ; its population is about 2000. After leaving the town he travelled onwards by the Engenho Gaucano, and village of San Amaro, the Engenhos Tropixe, Agoa Fria, Anjo Taceru, to the town of Seringhaem, upon the Seringhaem River, a place with very little commerce, and not above 1000 inhabitants. He visited the Engenhos St. Braz, Rosaria, Caxoeira, and Caxoeira Nova, and a beautiful little cascade upon the Seringhaem, and the mouths of the Formoso and Seringhaem, and after visiting the several Engenhos of Genepapo, Pandanbinha, Caetê, Salgado, Meoces, and Velho, and the town of Cape St. Augustin, a flourishing place, with a population of about 1500 souls. He arrived at the city of the Recife, Pernambuco, having accomplished a most arduous journey of 305 leagues in thirty-seven days, and lost six horses through the privations which they suffered.

MACEIO.—The port of Maceio, is protected by a reef of rocks, visible at ebb tide. The beach within it forms a semicircle of white sand. Immediately back from the beach are a row of white houses, with here and there groves of coqueiros, bearing fruit. Upon the hill above stands the city of Maceio, with a population of about 3000. There is not a convenient landing-place in its harbour.

In 1844 Maceio, contained two churches, in miserable repair, and two more in the process of erection, but no convents. Its other public buildings were a theatre, a government-house, barracks for soldiers, and a camara municipal. The theatre was ornamented outside with rude crosses and forms representing stars and circles; apparatus for illumination was affixed to all these ornaments. Notwithstanding various evidences of popular interest in this edifice, it stood open and apparently deserted, one of its sides having yielded to the force of gravitation, or having been pulled down for repairs. Most of the houses in Maceio are built of *taipa*, and, with one or two exceptions, do not exceed a single story in height. Children who are *not free* run about naked: free women employ themselves in lace-making. The shops are described as wretched. The place altogether is described as dull and uninteresting. There is an English and foreign burying-ground, but Mr. Kidder says, its gate, "made of wood, had been suffered to decay and fall in pieces, and thus the enclosure was left open and desolate. Many of the houses in the extremities of the town are very small, and covered only with a thatch of the cocoa-palm leaves."

The exports of the province of Alagoas are chiefly sugar, cotton, hides, Brazil-wood and rosewood. Sugar, in large cases, is brought from the interior, upon rude carts, drawn severally by six or eight oxen. The cotton comes in bales of about 180 pounds each. Of these a horse carries one on either side of a pack-saddle. Mules have not yet been introduced into this region as beasts of burden, although it is thought they would be more serviceable than horses. Of late the greater proportion of the productions of the province has been exported by way of Bahia and Pernambuco. Formerly foreign shipments were more frequent, and a greater number of foreigners resided in the place.

At one time two newspapers were published in Maceio, but, belonging to opposite political parties, they were continually wrangling with each other. Bad words soon led to bad deeds. Early one morning it was found that the *taipa* walls of one printing-office had been broken through, and its types and press destroyed. In a short time the other shared the same fate; neither have been re-established.

CHAPTER X.

PROVINCES OF BAHIA, SERGIPE, ESPIRITU SANTO, AND PORTO SEGURO.

THE PROVINCE OF BAHIA including the old captaincy *dos Ilheos*, extends from the Belmonte, in latitude 15 deg. 25 min. south, to the Rio Real, which divides it from Sergipe del Rey, in latitude 11 deg. 38 min. south,* being about

* Cazal states that the province extends from 10 deg. south latitude to 16 deg. south latitude; but neither the boundaries of this nor of some other provinces, are well defined.

300 miles in length. On the west and north-west, it is separated by the River San Francisco from Pernambuco; while, on the south-west it bounds on Minas Geraes. It is divided like Pernambuco, into the comarcas of Bahia, Ilheos, and Jacobina, the former two comprising the coast, and the latter the western part of the province.

With the exception of the descriptions of Prince Maximilian and Mr. Henderson, which in many instances are now obsolete, we have but little satisfactory information respecting the interior of this province. Mr. Kidder confines his account chiefly to the city of Bahia, and the British consul has not transmitted any accounts of the internal parts. Travelling across the province from Ilheos to Minas Geraes, primeval forests, mountains, hills, and plains are traversed. There are scattered villages during the route; and canoes ascend, though with great difficulty, and often danger, some of the rivers. Cultivation is not described in a flourishing condition in the province, although it is susceptible of the greatest extension and prosperity.

Its commerce is represented both by the British and French consuls, and by Mr. Kidder, to have been for some years on the decline. The British consul considers the diminished importation of flour (about one-half) as one indication of decline in the means of the inhabitants. The diminished sale of European manufactures he attributes to the same cause, and to the failure of agricultural crops, and he attributes the consequences of the revolutions of 1837 and 1838, as other causes. The trade of Bahia has also lost much of the exports of Sergipe and Alagoas, where the merchants of Pernambuco have formed branches of their commercial establishments. It will appear, however, from the tables of trade hereafter, that the trade of Bahia is rather stationary than retrograding.

THE PROVINCE OF SERGIPE DEL REY derives its name from the River Seregipe, an aboriginal name, on which St. Christovao the capital was first established,* but removed afterwards to another situation. Its conquest and colonisation were commenced in 1590, and was granted to Christovam de Barros, the deputy-governor of Bahia, as a reward for his services in reducing the natives. It was long considered a district of Bahia, but had its *ouvidors* about the year 1696. Having less natural advantages for commerce, this province has not made the same progress as the other maritime captaincies. Along its coast there are no capes, islands, or good ports. Its rivers have bars which are generally more or less dangerous, and afford little shelter, except to small vessels. The surface of the province is generally flat, there being scarcely a hill or mountain of any considerable elevation. The Serra Itabaiana, between the Rio Real and the Vazabarris, which, though more than twenty miles from the coast, is visible

* It received the name of St. Christovam in honour of Christovam de Barros, the first donatory. This town was destroyed by the Dutch in 1637.

at a great distance from the sea. Valuable Brazil and other woods grow on this serra. Casal divides the province into eastern and western. The former, in consequence of its woods, is called *Mattas*; the latter, which includes the larger portion of territory, has acquired, from the sterility of its soil, the denomination of *Agrestes*: the eastern part of the province yields sugar and tobacco, and the western is chiefly devoted to rearing cattle. A few *aldeias* on the River San Francisco, its northern boundary, are the most cultivated spots. In the eastern part, four settlements have been named towns,* besides Sergipe or St. Christovao, which, being the capital, ranks as a city. It is situated on an elevation near the River Paramopama, an arm of the Vazabarris, eighteen miles from the sea. *Sumacas* ascend to it, and take in sugar and cotton. It contains one or two convents, two chapels, a misericordia, a town-house, and a large bridge; all built of stone: it has plenty of good water. But the most populous and the busiest settlement in the whole province is or was, some time ago, the *povoação* of Estancia, five leagues from the sea, on the River Piauihy, which falls into the Rio Real, by which sumacas ascend to it. None of the rivers are navigable for large vessels, and the entrances of all are dangerous.

The commerce and industry of Sergipe and Bahia are so intimately connected, that the following statement by the French consul of establishments, &c., in 1843, includes both, viz., 728 sugar engenhos, 172 distilleries, seven snuff and fifty-five cigar manufactures, one paper, four soap, four candle works, one cotton factory, seventy-eight saw-mills, eleven ship-yards, nine printing presses, and ten newspapers.

CITY OF BAHIA.—Bahia de Todas os Santos, the Bay of All Saints, was discovered in 1503 by Americus Vespucius, under the patronage of the King of Portugal, Dom Manoel. Vespucius carried home from the east of Santa Cruz, as the newly-discovered country was first called by the Portuguese, a cargo of *ibiripitanga*, the dye-wood, which, when cut in pieces, resembled *brazas*, coals of fire. From which circumstance it acquired the name of Brazil wood, and also conferred a name on the country.

In 1510, a vessel under the command of Diogo Alvares Corrêa, was wrecked near the entrance of this bay. The Tupinambas, a ferocious tribe inhabiting the coast, fell upon and destroyed all who survived the shipwreck, save the captain of the vessel, Diogo, whom they spared, as some supposed, on account of his activity in assisting them to save articles from the

* These are, San Amaro, north of the confluence of the Sergipe and the Cotinquiba; San Luzia, near the River Guararema, above its junction with the Rio Real; Itabaianna, in the vicinity of the serra of that name: and Villa Nova de San Antonio, on the San Francisco, twenty-five miles below Propiã or Urubu de Baixo, the chief place in the Agrestes.

† *Memorias Historicas e Politicas da Provincia da Bahia*, in 4 vols. by Ignacio Accioli de Cerqueira, et Silva, a native of Bahia.

wreck. Bahia owes to this event its foundation, and its being long the capital of Brazil.

Bahia, or San Salvador de Bahia, stands on the western shore of the Bahia de Todas os Santos, which extends twenty-eight miles from south to north, and twenty from east to west. The bay has two entrances on both sides of the island of Itaparica, of which the eastern is about five miles wide, and is used by large vessels; the western, called Barra Falsa, is only two miles wide, and owing to its shallowness can only be navigated by coasting-vessels. The best anchorage is opposite the town of Bahia. The town consists of two parts, the Praya or Citade Baxa, and the Citade Alta, which has the aspect of an old city. The Praya (beach) is one street nearly four miles long, and contains the magazines and warehouses for inland produce and foreign goods. At its southern extremity are the arsenal and the royal docks, and about three miles north-east of it, at Tagagipe, the ship yards in which mercantile vessels are built. A steep and very difficult ascent leads to the Citade Alta. Those who can pay, are carried up in a cadeira or ornamented chair, which is supported on the shoulders of negroes. The upper town consists of stone houses from three to five stories high, and of a good appearance. In the centre are several squares surrounded principally by public buildings. The cathedral, the old Jesuits' college, now a hospital, and numerous churches, are the chief public buildings in the upper town. Mr. Kidder is silent as to the number of inhabitants of Bahia and other towns in this province. The population has been estimated as exceeding 180,000 souls.

Some of the streets, between the upper and lower towns, wind by a zig-zag course along ravines; others slant across an almost perpendicular bluff, to avoid, as much as possible, its steepness. Nor is the surface level, when you have ascended to the summit. Its extent between its extreme limits, Rio Vermelho and Montserate, is about six miles. The town of Bahia is nowhere wide, and for the most part is composed of only one or two principal streets. The direction of these changes with the various curves and angles of the promontory. Frequent openings, between the houses built along the summit, exhibit the most picturesque views of the bay on the one hand, and of the country on the other.

Great sums have been expended in the construction of pavements, but more with a view to preserve the streets from injury by rains, than to furnish roads for any kind of carriages. Here and there may be seen an ancient fountain of stonework, placed in a valley of greater or less depth, to serve as a rendezvous for some stream that trickles down the hill above; but there is no important aqueduct.

Beyond the city stands the ruined wall of a public cemetery. This cemetery had been laid out and prepared under the auspices of a company, to which had been conceded the privilege of making the interments for the whole city, to their future exclusion from the churches. This was a measure so impe-

ratively called for with respect to health, that it had met with but little opposition at first, and had obtained the sanction of the archbishop. But no sooner was the new cemetery opened for use, than the popular fury broke forth against it. The people assembled in a mob, excited by their priests, whose perquisites were about to be curtailed. When the troops were called out to quell the riot, they joined the mob, and the whole cemetery was defaced and ruined.

The hedges of the suburbs of Bahia are composed of lime-trees, the leaves of which, when newly-trimmed, emit an exquisite fragrance. Large jaca-trees, with their heavy fruit clinging to the limbs and trunk, together with other trees, are abundant here.

Descending towards the Red River, or rivulet, the route is beautifully ornamented by coqueiros, and other indigenous trees and shrubs. Close under the brow of the Antonio hill is the principal establishment connected with the whale-fisheries of the harbour.

On the capture of a whale in the bay, hundreds of people, the coloured especially, throng around to witness its dying struggles, and to procure portions of the flesh, which they cook and eat. Vast quantities of this fishy food are cooked in the streets, and sold by Quitadeiras. Swine also feast upon the remains. This fishery, at the close of the seventeenth century, was rented to contractors by the crown for 30,000 dollars annually. The American whalers occasionally take whales off this coast, but in general they find other cruising grounds more profitable.

Ascending a winding path from the beach to the Victoria Hill, the English cemetery is beautifully situated.

In the principal parts of the city, there is an almost entire absence of horses and mules in the streets; but there is an unlimited number of goats and pigs.

The old cathedral, an immense edifice, which had been constructed with great expense, is now in a very neglected state. One of its wings is appropriated to the public library. It contains about 10,000 volumes, a large portion of which are in French, and some valuable manuscripts. In its immediate neighbourhood, are the archiepiscopal palace and seminary, and the old Jesuit college, now used as a military hospital. The latter building, together with the church of Nossa Senhora da Conceição on the Praya, may almost be said to have been built in Europe, from whence the stones, regularly prepared for use, were imported. There are numerous other churches—the president's palace, a substantial building of ancient date.

In 1811, a gazette, entitled "The Golden Age," was commenced; but a board of censors was appointed by the archbishop. At the same period the public library was founded, through the liberality of individuals.

In the year 1815, the first steam sugar-mill was introduced from England.

The public promenade of Bahia is situated on the boldest and most commanding height of the old town. One of its sides opens towards the ocean, and another up the bay; an iron railing protects the visitor from danger of falling over the steep precipice by which extends its whole front. The space allotted to the battery is laid out in good taste; but the variety and beauty of the trees and flowers of the Passeio Publico render it a delicious promenade.

“During the fête on the anniversary of the birth of the young emperor,” says Mr. Kidder, speaking of the Passeio Publico; “here it was, under the dark dense foliage of the mangueiras, the lime-trees, the bread-fruit, the cashew, and countless other trees of tropical growth, that about 9000 lights were blazing. Most of these hung in long lines of transparent globes, so constructed as to radiate severally the principal hues of the rainbow, and waved gracefully in the evening breeze as it swept along, laden with the fragrance of opening flowers.”

The Dias de grande gala, or political holidays, are celebrated throughout the empire. These are six in number: first, New Year's day, or that of paying compliments to the emperor and his representatives in the provinces; the second, on the 25th of March, the anniversary of the adoption of the constitution; the 7th of April, that of the emperor's accession; the 3rd of May, or that of opening the legislative assembly; the 7th of September, that of the declaration of independence; and the 2nd of December, or the emperor's birthday. On the celebration of the latter, Mr. Kidder says;—

“The wealth, fashion, and beauty of the Bahians never boasted a more felicitous display than was mutually furnished and witnessed by the thousands that thronged this scene. What an occasion was here offered to the mind disposed to philosophise on man. From hoary age to playful youth—no condition of life or style of character was unrepresented. The warrior and the civilian, the man of title, the millionaire, and the slave, all mingled in the common rejoicings; while the practised eye would not have failed to discern in the crowd, the lurking desperado and assassin. Never, especially, had the presence of females in such numbers, been observed to grace a scene of public festivity. Mothers, daughters, wives, and sisters, who seldom were permitted to leave the domestic circle except in their visits to the morning mass, hung upon the arm of their several protectors, and gazed with undissembled wonder at the seemingly magic enchantments before and around them. The dark and flowing tresses, the darker and flashing eye of a Brazilian belle, together with her sometimes darkly shaded cheek, show off with greater charms from not being hid under the arches of a fashionable bonnet. The graceful folds of her mantilla, or of the rich gossamer veil which is sometimes its substitute, wreathed in some indescribable manner over the broad, high, and fancy-wrought shell that adorns her head, can scarcely be improved by any imitation of foreign fashions. Nevertheless, the *forte* of a Brazilian lady is in her guitar, and the soft *modinhas* she sings in accompaniment to its tones.

“Besides its walks and its natural scenery, the Passeio Publico presented two objects of special attraction. One was the marble monument erected in memory of Dom John's visit to Bahia. In another quarter, upon a high parapet overlooking the sea and bay, had been constructed a fancy pavilion, in the style of an Athenian temple.”

The Island of Itaparica is about eighteen miles long, and five wide on an average. It has a population estimated at 16,000 souls, of whom 7000 were said to

live in its town. San Amaro, situated on a river which falls into the northern extremity of the bay, in a country abounding in sugar and tobacco, was estimated to contain 10,000 inhabitants. Caxoeira, on the River Paraguassu, is built at the point to which the tide ascends, and near some cataracts which interrupt the ascent of the river. In its neighbourhood there are plantations of sugar and tobacco; it contains 25,000 inhabitants. Camamu, is a seaport south of the Bahia, and with an estimated population of 8000 inhabitants; exports to the capital mandioc, rice, maize, coffee, and the bark of the mango-tree, which is used in tanning. A row of small islands and rocks skirt the shores north of the Bahia de Camamu, and form a channel by which small vessels can proceed to the Barra Falsa, without being exposed to the dangers of an open sea.

Excursions are made in boats from Bahia round its magnificent bay and islands. One of these Mr. Kidder describes—

“We first steered,” he says, “for Itaparica, and promptly traversed the nine miles intervening between the city and that island. Passing round the upper extremity of the island, we came to its principal port, and went on shore by means of canoes that immediately gathered around the steamboat. Here we found a villa defended by a fort, having two churches, and about 300 small, low houses.

“We next touched at Bom Jesus, a small island situated on the south side of the Ilha dos Frades. Here were a Matriz, or mother church, and a few small dwellings, located without order on the Praya.

“Returning, we passed near other islands, which, with their small villages, appeared exceedingly picturesque. As the sun was setting we passed by the small promontory of Bom Fim, and enjoyed a perfect view of the city.

“What can be more beautiful than those extended and curving lines of whitened buildings—the one upon the heights, the other upon the water’s edge—everywhere separated by a broad, rich belt of green, here and there dotted with houses. Nowhere does the uniformity of whitened walls and red-tiled roofs show to finer advantage, in contrast with the luxuriant vegetation that surrounds them. In fact, there are few cities that can present a single view of more imposing beauty than does Bahia, to a person beholding it from a suitable distance on the water. Even Rio de Janeiro can hardly be cited for such a comparison. That city excels in the endless variety of its beautiful suburbs: yet I should be at a loss to point out one which, in all respects, equals that part of Bahia known as the Victoria Hill. In Rio, one section competes with another, and each offers some ground of preference; but in Bahia, the superiorities seem all to be united in one section, leaving the foreigner no room for doubt or discussion respecting the best quarter for locating his residence. On the Victoria Hill may be found the finest gardens that Bahia afford, the most enchanting walks, and the most ample shade. Here too are the best houses, the best air, the best water, and the best society. The walls of two ancient and extensive forts, also add very much to the romantic and historical interest of the place. In fine, he who looks for any one spot that combines more of external beauty, than does that to which I refer, will roam long and widely over the face of the earth.

“In the lower town there are various *fabricas de imagens*—image manufactories. Saints, crucifixes, and every species of ghostly paraphernalia of Romanism are exhibited in the shops with profusion that I nowhere else saw, indicating that the traffic in these articles was more flourishing here than in other parts. It is not in name only that Bahia enjoys the ecclesiastical supremacy of Brazil. It is the seat of the only archbishopric in the empire. Its churches exceed in number, and in sumptuousness, those of any other

city; and its convents are said to contain more friars and more nuns than those of all the empire besides.

"In 1827, the pope issued a bull making the Brazilian Benedictines independent of their order in Portugal. Dissensions then broke out among them, when the election of an abbot-general took place at Rio de Janeiro. The pope's legate attempted to interfere, but was repulsed. The order, after this feud, became almost extinct, and the national assembly was allowed to confiscate its possessions! but did not succeed, and licence was granted them to receive more novices.

"Some of those who were admitted under this licence became so insubordinate, that that the abbot of the convent at Rio was obliged to call in the police of the city to maintain order.

"The Slippered Carmelites and the Barefooted Carmelites in Bahia, have been much more distinguished for wranglings among themselves, and for evasions of the revenue-laws, and of their own rules forbidding them to hold property, than for any special virtues or good works. The latter order is now nearly extinct, and the archiepiscopal seminary occupies their convent. The monks of the congregation of St. Philip Neri founded a hospicio on the Praya in 1756, but their succession having failed, the hospicio was transferred into an orphan asylum.

"The Barefooted Augustineans and the Almoners of the Holy Land, at one time had each small establishments in Bahia, but their building have been turned to secular purposes.

"The nunneries of Bahia are in the order of their foundation, as follows:—
1. The convent of Santa Clara do Desterro. 2. The convent of our Lady of Solitude. 3. The convent of our Lady of the Cliff. 4. The convent of our Lady of Mercy. Besides the regular nunneries, there are two recolhimentos.

"The Italian Capuchins are bearded impertinent mendicants of most filthy appearance. They have never been numerous in Bahia. They have a hospicio or small convent, and a splendidly decorated chapel in the town."

TRADE OF BAHIA.

The commerce of this port as well as of the naturally rich province of which it is the capital, has, especially since 1837, been declining.

The attempts to suppress the slave-trade, is urged as the chief reason for this diminished trade; for Bahia being opposite to the coast of Africa, was from early times the principal rendezvous for the slave-traders. The British consul informs us, that the planters of coffee in the south of the province of Bahia (Caravellas, Villa Vicoza, &c.),

"Find it more to their interest to send their crops to the market of Rio de Janeiro, where they obtain better prices; they are partly obliged to do so, to meet their engagements for the payment of slaves, at which place they can be obtained with greater facility, and at a much lower rate than in this province. The crops of tobacco are greatly diminished, occasioned by the abolition of the slave-trade. In the year 1817, the quantity of tobacco exported having been 660,000 arrobas, and during the year 1840, only to 231,243 arrobas, leaving a decrease of 428,757 arrobas. The quantity of rum made being dependent on the crops of sugar, has also diminished in proportion, and a great part of that made is now consumed in the province.

"Sugar is the staple produce of Bahia, and as the planters possess a considerable number of slaves, there will be little reduction in quantity.

THE Exports from Bahia in 1846 were as follows :

ARTICLES.	Quantity,	Value.		Average Price.		TOTAL VALUE.

Imports consist principally of the following commodities; viz., from Great Britain and her colonies:

Ale and porter; anchors; arms; bees'-wax; blacking; butter; candles, tallow; ditto, sperm; chain cables; cheese; coals; coal tar; cod-fish; copper; cordage; cutlery; drugs; earthenware; glass; glass-bottles; gunpowder; hams; hats; iron in bars; ditto in hoops; ironmongery; lead; leather; linseed oil; manufactures; nails; paints; paper; pianos; pickles; pitch; provisions; saddlery; sail cloth; saltpetre; soap; steel; tar; tin plates; white lead; wearing apparel, &c.

From France.—Arms; brandy; butter; candles, tallow; ditto, sperm; cheese; drugs; glass; glass-bottles; haberdashery; hats; leather; manufactures; olive oil; paper; perfumery; raisins; saddlery; wearing apparel; wine.

From Portugal.—Bees'-wax; candles, tallow; drugs; earthenware; hams; hats; ironmongery; leather; nails; olive oil; salt; snuff; vinegar; wine.

From the United States.—Candles, tallow; ditto sperm; cod-fish; cordage; deals; drugs; flour; furniture; gin; hams; manufactures; provisions; resin; soap; tar; tea; tobacco; whale oil.

From Sardinia.—Brandy; candles, tallow; drugs; manufactured silk; olive oil; paper; raisins; steel; vermicelli; wine.

From the Hanseatic cities.—Brandy; candles, tallow; cheese; coal tar; cordage; demijohns; drugs; gin; copper; glass and glass bottles; hams; ironmongery; leather; linseed oil; manufactures; paints; pianos; provisions; sail-cloth; tar; tin plates.

From Denmark.—Cheese; cordage, demijohns; gin; linseed oil; manufactures; pitch; provisions; sail cloth; tar.

From Holland.—Cheese; demijohns; gin; glass; ditto bottles; linseed oil; manufactures; white lead; window-glass; zinc.

From Spain.—Brandy; drugs; olive oil; paper; raisins; salt; soap; wine.

From Austria.—Flour; manufactures; olive oil, can; soap; steel; wine.

From Sweden.—Deals; masts; mess beef; iron; pitch; tar.

From Sicily.—Brandy; drugs; olive oil; raisins; salt; soap; wine; brimstone.

From Monte Video.—Candles, tallow; hides; horns; jerked beef; lard; tallow.

The general regulations with respect to trade at this port are the following:

Merchandise imported is first landed at the custom-house, or bonded warehouses, where bulky articles are allowed to remain one month, and others four months, for which accommodation a charge is made of three and a half per cent on its valuation. If not removed at the expiration of these respective periods, an additional charge is made of one quarter per cent per month.

Three months' credit is granted to merchants, by giving security for the amount of duties, for which they pay an interest of six per cent per annum.

The greater part of the commodities imported are sold on credit, varying from two to eight months, according to the stock in the market. Although these credits are stipulated, the payments generally depend on the season when the crops are brought for sale, consequently merchants are obliged to have an immense capital outstanding in this country, and finally, are frequently obliged to receive produce in payment, at higher prices than it might be bought for in cash.

All that produce, which is not received in payment for this merchandise, is bought for cash. It is deposited, on its arrival from the interior, in bonded warehouses, whence it is shipped, after paying the export duty.

There are no privileges of importation in favour of ships belonging to this country, they are on the same footing as foreign vessels, with the exception of the coasting trade, which is exclusively carried on by Brazilian vessels. There is no difference made in the duties on goods, whether imported in Brazilian or foreign vessels.

Statement of Port charges at Bahia on all Vessels Foreign or National.

	rials.
Tonnage duty on vessels which discharge and load here	900 per ton.
„ „ on vessels which enter in ballast and load here or vice versâ	450 „
„ „ on vessels which enter and sail in ballast, or call for refreshments	30 per ton edpary.
Vessels which enter the port in distress pay no tonnage duty.	
Hospital duty—for every person belonging to the crew	640 „

Bahia, at present, is the only port of this province wherein goods may be warehoused on importation, and afterwards exported.

Weights and Measures.—Quintal, four arrobas; arroba, thirty-two pounds; canada, two imperial gallons; alqueire, seven-eighths of a bushel.

PROVINCE OF ESPIRITU SANTO AND PORTO SEGURO.—Of these united districts, which extend from the frontiers of the provinces of Rio Janeiro, and that of Bahia, we have very little recent information. They are the least known and the least commercial in Brazil. No author of much repute, except Prince Maximilian, of Nieuwied has traversed the interior, and we have in the general description of the country, briefly given parts of his information. Neither of these provinces appear to have any foreign trade, yet they have a sea coast of more than 400 miles in extent.

Espirito Santo comprehends about three-fourths of the capitania, granted in 1534, to Vasco Fernandez Coutinho, as a remuneration for his services in Asia. It extends from the River Capabuan (or Itabapua, the boundary

of Rio Janeiro) to the Rio Doce, which separates it from Porto Seguro, on the north. On the west it borders on Minas Geraes.

"The lofty and naked ridge of Middle Brazil," remarks Prince Maximilian, "in the provinces of Minas Geraes, Goyaz, and Pernambuco, is divided from the eastern coast by a broad tract of high forests, which extend from Rio de Janeiro to the Bay of All Saints (Bahia), about eleven degrees of latitude, and which are not yet taken possession of by the Portuguese settlers; only a few roads have hitherto been opened, with infinite labour, along the rivers that traverse them. In these forests where the primitive inhabitants, who are pressed upon at every other point, have till now enjoyed a serene and peaceful abode, we may still find those people in their original state."

Cazal says, that of the whole maritime ports of Brazil Espiritu Santo has made the least progress; and that the civilised population is almost entirely limited to the sea-coast. The salubrity of the climate and fertility of the soil, would appear to render this province susceptible of the most prosperous improvement. But the greater part seems to be covered with original forests. Brazil-wood, the cedar, the sassafras-tree, and various other resinous and aromatic species, and Peruvian balsam are all said to be abundant.

From Itabapuaa northward, to the banks of the Itape-mirim, a distance of little more than twenty miles, the district was not long since so dangerous, that a *quartel*, or military post was established for protection against the Puries. On the south bank of the Itape-mirim, there was built a village inhabited partly by small planters, fishermen, and a few mechanics. This river is narrow, but a small trade has been carried on, in sugar, cotton, rice, millet, and timber. The Serra de Itape-mirim, was celebrated for the works for washing gold, called Minas de Castello, five days' journey up the river. That district was, however, so molested by the Tapuyas, that the few Portuguese settled there left it about forty years ago, to reside in the town. The country higher up was inhabited chiefly by Puries, and Botucudoes, called "the real tyrants of the wilderness," also come down occasionally to plunder.

Prince Maximilian traversed the wilds by the route which leads from Minas de Castello to the frontier of Minas Geraes, a distance of about twenty-three leagues.

On the first day's journey from Itape-mirim they reached the Fazenda de Aga, near the *morro* of Aga, a lofty, round mountain. Near Aga is the *povoação* of Piuma (or Ipiuma), where there is a wooden bridge over the rivulet, three hundred paces in length; "a real curiosity in these parts." After riding through a hilly country of woods and meadows, they reached the Villa Nova de Benevente, at the foot of a hill on the north bank of the Iritiba or Reritigba, and founded by the Jesuits, who had collected at this place 6000 Indians, their church and convent is still seen on the eminence commanding the town. It was the largest *aldeia* on this coast, till the Indians were destroyed, or driven away by the hard labour exacted of them.

Villa de Goaraparim, the next town, was found to be a poor place. The houses are only of one story, and the streets are unpaved. The district was said

to contain about 3000 souls. The road from Benevente passes through magnificent forests to the Atlantic.

"At one place," says Prince Maximilian, "we met with an extremely beautiful grove, consisting entirely of *airi* palms. Young vigorous trees of this species, from twenty to thirty feet high, rise with their straight, dark brown stems, surrounded with thorny rings. Their beautifully feathered leaves screened the damp ground from the scorching noon-tide sun; while younger ones which had not yet any stem, formed the brush-wood, above which old dead palms, withered and decayed, projected like broken columns. Upon these trees, devoted to destruction, the solitary, yellow-hooded woodpecker, or beautiful species with the red head and neck, was at work. The flower of the flame-coloured heliconia covered the low bushes near us, round which twined a beautiful convolvulus with the finest azure blue-bells. In this magnificent forest, the ligneous creeping plants, again showed themselves in all their originality, with their curvatures and singular forms. We contemplated with admiration the sublimity of this wilderness, which was animated only by toucans, parrots, and other birds."

Beyond this wood, were some fishermen's huts, the *povoação de Obu*; and then another containing sixty or eighty families of fishermen, called *Miaipé*. He halted again at Goaraparim; the next day he reached a little fishing hamlet on the coast, called *Ponta da Fruta*, and on the day following, five leagues further, through marshy meadows and woodland, brought him to Villa Velha, a wretched place on the Rio de Espiritu Santo. This river is of considerable magnitude, and it is said to be navigable to the first fall, a distance of forty miles, and the tide runs up about twelve miles, to the mouth of the River Serra, which joins it on the left bank. Several other streams fall into it.

On a high, conical hill, covered with wood, immediately joining the town, there stood at that time the Franciscan convent of Nossa Senhora da Penha, one of the richest in Brazil, dependent on the Abbey of St. Bento at Rio:—

"It is said," adds Prince Maximilian, "to possess a wonder-working image of the Madonna, for which reason numerous pilgrims resort thither; but at the period of our visit, there were only two ecclesiastics on the spot. It is well worth the trouble to ascend the steep eminence, in order to enjoy the inexpressibly grand prospect which there offers itself to the view. It overlooks the wide expanse of the ocean, and, on the land side, fine chains of mountains and various peaks, with interjacent valleys, from which the broad river issues in the most picturesque manner imaginable."

About half a league from Villa Velha, on the opposite side of the bay, stands the capital of the province, Villa da Victoria. It is built, according to Casal, "on an amphitheatrical site, on the western side of an island, fifteen miles in circumference," and is thus described by the Prince of Nieuwied.

"The *cidade de Nossa Senhora da Victoria* is a pretty, neat place, with considerable buildings, constructed in the old Portuguese style, with balconies or wooden lattices, neat paved streets, a tolerably large town hall, and a Jesuits' convent, since occupied by the governor, who has a company of regular troops at his disposal. Besides several convents, there are a church, four chapels, and a hospital (*misericórdia*). The town is, however, rather dull, and visitors, being very uncommon, are objects of great curiosity. The coasting trade is not unimportant; several vessels are in consequence always lying here, and frigates can sail up to the town. The neighbouring *fazendas* produce sugar, mandioc, flour, and rice, bananas, and other articles which are exported along the coast. Several forts protect the entrance of the fine River Espiritu Santo; one directly at the mouth; a second battery, built of stone, higher up, with eight iron guns; and still

further up on the hill between the latter and the town, a third battery of seventeen or eighteen guns, a few of which are brass. The town is built rather unevenly, on pleasant hills; and the river flowing past it, is here everywhere enclosed within high mountains, partly consisting of rocks, which are in many places naked and steep, and covered with creeping plants. The beautiful surface of the broad river is broken by several verdant islands, and the eye, as it follows its course up the country, everywhere finds an agreeable point of repose in lofty, verdant, wood-covered mountains."

The River Jucu falls into the ocean about three miles to the south of the entrance of the bay; it abounds in fish. About four leagues up this river is the large fazenda of Araçatiba. The great forest of Araçatiba, through which lies the route to the fazenda, is described as a dismal wilderness. Emerging from it, the travellers came into an open country, where they were agreeably surprised all at once to see a large white building, presenting an extensive front of two stories, with two small towers, situated on a beautiful green level spot at the foot of the lofty morro. Near the house was a church; and at the foot of a hill were the negro huts, the sugar-mill, and the farm buildings. The estate employed 400 negroes. About a league distant, on a romantic spot on the River Jucu, entirely surrounded with lofty primeval forests, was a second fazenda, called Coroaba, not far from which was the military post of St. Agostinho. The government had settled there about forty families, who came from the Azores. These people, who lived in great poverty, bitterly complained of their wretched condition, splendid promises having been made to them but not performed.

Proceeding along the coast, two days' journey from Villa da Victoria, they came to Villa Nova de Almeida, a large village of civilised Indians, founded by the Jesuits on elevated ground near the mouth of the Rio dos Reis Magos (river of the royal magi). In no other parish of the province had the number of native Indians increased so much as this. It had a large stone church, and contained in its whole district, nine leagues in circumference, about 1200 souls.

"The inhabitants of the village," adds Prince Maximilian, "are chiefly Indians, but there are also some Portuguese and negroes. Many possess houses here, to which they come from their plantations on Sundays and holidays only. The Jesuits here formerly gave instruction in the *lingoa geral* (general language, i. e. of the Indians). The Indians derived their subsistence from their plantations of mandioc and maize; they also exported some wood and earthenware, and carry on a fishery, which is not inconsiderable, on the sea and the River Sahuanha, or Dos Reis Magos, which runs past the village.

"To the north of the Sahuanha, the whole coast is covered with thick woods. In a few hours you come to the River Pyrahassu (great Fish River). Here, at the *barra*, or mouth, is a hamlet of a few houses, called Aldea Velha; and rather higher up the river, a considerable village was founded by the Jesuits. The chief subsistence of the aborigines was derived from shell and other fish, whence great heaps of shells are still found on the bank of the river."

After crossing the Pyrahassu, here a deep, broad, and rapid stream, the travellers entered a magnificent forest; on emerging from which, their road lay for four leagues along an uninteresting tract of coast, broken by a succession of small promontories and inlets, to the *quartel do Riacho*, a military post, from whence, by a fatiguing journey of eight leagues through deep sand, they reached the *quar-*

tel da Degencia, at the mouth of the Rio Doce, the boundary of the province, and the most considerable river between Rio de Janeiro and Bahia. At a short distance from the coast, between the quartel do Riacho and the Doce, extends the *Lagoa dos Indios*.

The River Doce (sweet river) assumes that name after the confluence of the Rio Piranga with the Ribeiro do Carmo. It flows through a considerable extent of country, forming several small falls, three of which succeeding each other at short intervals, are called the *Escadinhas* (stairs). Two miles below these falls, the Doce receives the Mandu, which comes from the interior, running north-north-east between woods, and is navigable for canoes.

"The banks of the beautiful river, Doce," says Prince Maximilian, "are covered with thick forests, which are the haunt of a great number of different animals. Here are frequently found the anta, or American tapir, two kinds of wild swine (the *caytetu* or peccary, and the *porco a quechada branca*), two species of deer, and above seven varieties of the cat kind, among which the spotted ounce and the black tiger are the largest and most dangerous. But the rude, savage Botucudo, the aboriginal inhabitant of this country, is far more formidable than all those beasts of prey, and is the terror of these impenetrable forests. This part of the country is still very thinly peopled. The Conde de Linhares, late minister of state, had particularly directed his attention to this fertile and beautiful country. He established new military stations, and built the village now called after him, Linhares, eight or ten leagues up the river, at the place where the first military station had formerly been. He sent thither deserters and other criminals, to people the new colony; and these settlements would certainly have prospered in a short time, had not death too soon carried off that active minister."

Prince Maximilian, desirous of exploring the banks of this river, embarked on the following morning in a long canoe rowed by six soldiers:—

"In order to ascend the Rio Doce, when it is at its height, four men at least are necessary, who propel the canoe with long poles (*varas*). As there are everywhere shallow places, which in the dry season appear as sand-banks, the poles can always reach them, even when the water is high; and with the most favourable combination of circumstances, it is possible to reach Linhares in one day, but not till late in the evening.

"The weather was very fine, and when we had become accustomed to the rocking of the narrow canoe, caused by the soldiers walking backwards and forwards to push it along, we found the excursion very agreeable. When it was quite daylight, we saw the broad surface of the rapid stream glistening in the morning sun. The distant banks were so thickly covered with gloomy forests, that in the whole of the long tract which we passed there was not a single open spot which would have afforded room even for a house. Numerous islands of various sizes and forms rise above the surface of the water; they are covered with ancient trees of the most luxuriant verdure. The water of the Rio Doce, when at its height, is turbid and yellowish, and is universally asserted by the inhabitants to generate fevers. It abounds in fish; even the saw-fish (*pristis serra*) comes up far above Linhares, and into the *lagoa* of Juparanan, where it is frequently caught.

"From the forests we heard the cries of numerous monkeys, particularly the *barbados*, the *saiassus*, &c. Here it was that we first saw in their wild state the magnificent macaws (*psittacus macao*, Linn.), which are among the chief ornaments of the Brazilian forests; we heard their loud screaming voices, and saw these splendid birds soaring above the crowns of the lofty *sapucaya* trees. We recognised them at a distance by their long tails, and their glowing red plumage shone with dazzling splendour in the beams of the unclouded sun. Parroquets, maracanas, maitaccas, tiribas, curicas, camutangas, nandayas, and other species of parrots, flew, loudly screaming, in numerous flocks from bank to bank; and the large and stately Muscovy duck (*Anas moschata*, Linn.) alighted on the branch of a cecropia, in the margin of the forest on the bank of the river. The

black skimmer (*rynchops nigrar* Linn.) sat motionless and with contracted neck upon the sand-banks : toucans and the çurucas (*Trogon viridis*, Linn.) uttered their loud cries.

"The banks of the islands and of the channel were for the most part thickly overgrown with the high fan-like reed, the sheath of whose flower is used by the Botocudos for their arrows.

"We proceeded up the river past several islands, and into a channel between the Ilha Comprida and the north bank of the river. The current was by no means so strong here, but then we met with many fallen trunks of trees and large branches, which we had to clear away before we could advance further. The bushes and lofty ancient trees, which border this channel, present the most diversified and magnificent spectacle. Various kinds of cocoas, especially the elegant *palmito* (in other parts called *jissara*), with its tall, slender stem, and the small bright, green, beautiful feathery crown, adorn these dark forests, from the recesses of which the calls of unknown birds strike the ear. Below, close to the water were some splendid flowers.

"A *jacaré*,* quietly basking in the sun fled at the sound of our oars. We soon came to several islands, upon which the people of Linhares had made plantations; for it is only on these islands that they are quite safe from the savages, who have no canoes, and therefore cannot cross, except where the breadth and depth of the river are inconsiderable. The officer called *guarda mor* resides in the Ilha do Boi (Ox Island), and the priest of Linhares on the Ilha do Bom Jesus. Towards noon we came in sight of Linhares, and landed on the north bank."

By order of the Count Linhares, the buildings were erected in a square, upon a spot cleared of wood, near the bank of the river, and on a steep cliff of clay.†

The commanding officer at Linhares was obliged to make the tour of all the posts, a journey of ninety leagues, once a month.

Not far from Linhares, on the north side of the Doce is the *Lagoa de Juparanan*, communicating with the river by a deep channel, about sixty feet broad, and a league and a half in length. This lake, which is surrounded by hilly banks, is about seven leagues in length from south-east to north-west, half a league broad, and from sixteen to eighteen leagues in circumference. Its depth is, in many places from eight to twelve fathoms.

THE DISTRICT OF PORTO SEGURO is bounded by the rivers Doce and Belmonte on the south and north, its western boundaries are Minas Geraes. It lies

* The *jacaré* of the east coast of Brazil is far inferior to the gigantic crocodile of the old world, and even to those met with in the countries of South America nearer to the equator. This species is not feared; they are never more than eight or nine feet in length.

† "In order to protect this settlement in general from the attacks and cruelties of the Botocudos, eight stations had been established, which are pushed forward in different directions into the great forests; they are also destined to protect the commercial intercourse which has been attempted to open up the river with Minas Geraes. Soldiers have come down from that province in sufficient numbers, well armed and provided with the defensive coat, called *gibao d'armas*. These coats, some of which are kept at all the stations, are an indispensable covering against the arrows, which the savages discharge with great force. They are wide, made of cotton, and thickly lined with several layers of cotton wadding, have a high stiff collar, which covers the neck, and short sleeves that protect the upper part of the arm: they come down to the knee, but are very inconvenient, on account of their weight, especially in hot weather. The strongest arrow, even when discharged near at hand, does not easily penetrate such a coat, and it never has force enough to inflict any serious wound. I directed one of my hunters to fire at one with a rifle, at the distance of eighty paces, and the ball penetrated both sides of the coat. It appeared, however, on further trials, that the largest shot fired at the distance of sixty paces, fell flattened to the ground, without penetrating, and that these coats are, therefore, a sufficient defence against arrows."

between 19 deg. 33 min. and 15 deg. 25 min. south latitude,* and is consequently about sixty-five leagues in length. It was on this part of the coast that Cabral first landed, and took possession, for the crown of Portugal, of Brazil. "But if," remarks Mr. Southey, "the port from which the province is named be the place where Cabral first anchored, his ships must have been of no considerable burden, or the depth of the port must have diminished, for within the bar it shallows to twelve feet."

The town of Santa Cruz was begun upon Cabralia Bay (the Bay of Cabral), but the settlement was transferred to the banks of the Joao de Tyba, four miles to the northward, in consequence, Cazal states, of its more favourable soil. The Jesuits, who founded a college in the capital in 1553, with a view to prosecute their labours among the Indians of this province, left only two aldeias entirely Indian, at the time of their expulsion. In fact, less progress has been made in civilising the aborigines than cultivating the soil in Porto Seguro, than even in Espiritu Santo, still more backward in cultivation. The civilised inhabitants are almost wholly confined to the neighbourhood of the coast, and the interior is almost a continued forest abounding with the finest timber.

From the banks of the Rio Doce to the San Matthæus, a wilderness extends along the coast, twenty leagues in length; for the greater part of the way not even fresh-water is said to be found. At two leagues from Regencia, is the *quartel de Monserra*, near which is a long, narrow lake, called *Lagoa de Juparanan da Praya*, communicating with the sea by a broad channel, which is dry at low water. Some leagues further, in a small, low valley, is another lake, called Piranga; and beyond this, the road crosses the *Barra seca*, the outlet of a third lake, abounding in fish. In this neighbourhood are extensive campos. Turtle frequent the coast.†

Above the bar of the river is the town of San Matthæus, situated in

* On the authority of Mr. Lindley, which agrees with Prince Maximilian's map, Mr. Henderson says, between 15 deg. 54 min. and 19 deg. 31 min. south latitude.

† Cazal mentions only one lake between the Doce and the San Matthæus, which he calls the Lake Tapada, and describes to be "of considerable length from east to west, but very narrow."—Henderson.

Prince Maximilian says, "While our people were employed in fetching some sea-water, and in picking up drift wood on the beach, we found to our great surprise, at a short distance from our fire, a prodigious sea-turtle (*testudo mydas*, Linn.) which was just going to deposit its eggs. Our presence did not disturb it; we could touch it and even lift it up; but to do this it required the united strength of four men. The creature manifested no sign of uneasiness but a kind of hissing, nearly like the noise made by the geese when any one approaches their young. It continued to work, as it had commenced, with its fin-like hinder feet, digging in the sand a cylindrical hole from eight to twelve inches broad; it threw the earth very regularly and dexterously, and, as it were, keeping time on both sides, and began immediately after to deposit its eggs.

"One of our soldiers laid himself all along on the ground near the purveyor of our kitchen, and took the eggs out of the hole as fast as the turtle deposited them; and in this manner we collected 100 eggs in about ten minutes. We considered whether we should add this fine animal to our collections; but the great weight of the turtle, which would have required a mule for itself alone, and the difficulty of loading such an awkward burden, made us resolve to spare its life, and to content ourselves with its eggs.

"Those huge animals, the *midas* and the soft-shelled turtle (*testudo mydas* and *coriacea*) as well as the *testudo caretta*, or *cavanna*, deposit their eggs in the sand in the warmest months in the year, particularly in this uninhabited part of the coast between the Riacho and the Mucuri."

the midst of swamps, which render the place far from healthy; but the fertility of the soil has attracted numerous settlers to this quarter. "As one of the newest towns in the province of Porto Seguro," says Prince Maximilian, "it is in a thriving condition. It then contained about a hundred houses, and has in its district nearly 3000 inhabitants, both whites and people of colour." The inhabitants cultivate mandioc, and export its flour, and also planks from the forests. Here the orange, the lemon, and the water-lemon flourish luxuriantly. Eight leagues from the town of San Matthæus, up the river, is the station of Galveyas.

The River San Matthæus, originally called the Cricare, has its source in Minas Geraes, and descends through the forests, forming several small falls and receiving in its course several streams. Casal mentions the large River Cotache as joining it on the left margin, soon after the last fall. The northern bank is frequented by Patachoes, Cumanachoes, Machacalies, and other tribes, as far as Porto Seguro. The southern bank is believed to be chiefly occupied by Botucudoes. In this river is found manati. Fish of various kinds is said to abound.

About half a league from San Matthæus, the little River Guajinteba falls into the sea. On this river is the fazenda of *As Itaiunas*. Beyond this, three small streams, the Riacho Doce, the Rio das Ostras, and the Riacho da Barra Nova, also discharge into the Atlantic. The Villa de San Joze do Portalegre, situated at the mouth of the Mucuri, is distant, according to Casal, nearly thirty miles from the San Matthæus.

This town is commonly called *Portalegre*. The inhabitants are chiefly Indians, and are very poor; but some trade has been attracted to it. Almost all the fine species of wood found on the eastern coast of Brazil abound in the forests of this district. About a day's journey and a half up the river, a fazenda had been established by the Conde da Barca, at a spot called, from the number of araras or maccaws, Morro d'Arara, on the banks of a spacious lake. Here, Prince Maximilian took up his residence for several months.

"In these solitary wildernesses," he says, "the chase was our most agreeable, most useful, and indeed only occupation; and though the insecurity of the forests laid us under many restraints, and obliged us to make it a rule never to go out, except in sufficiently numerous parties, yet we always procured abundance of game. Whenever we went out of our huts in the morning, we heard the loud drum-like voice of the barbados (*mycetes*), and the hoarse growl of the gigo, another hitherto nondescript monkey; the maccaws, which flew loudly screaming over our huts, in pairs, threes, or fives, joined in this noisy concert, which re-echoed through the woods; and we were in like manner surrounded by flocks of parrots, of schaiïas, maitacas, jurus (*psittacus pulverulentus*, Linn.), curicas, and many other kinds."

Five leagues to the north of the Mucuri, is the River Peruhipe, on the southern margin of which, four miles above its mouth, is the little town of Villa Viçosa, consisting of about 100 houses, with a church and *camara*, pleasantly situated among groves of cocoa-palms, which give an interesting character to the landscape. The inhabitants carry on some trade in mandioca flour, which is exported in small coasting-vessels.

Caravellas, situated on the northern margin of the river of the same name, about five miles from the sea, and ten miles north of the Peruhipe. It has straight streets, intersecting each other at right angles. The houses are neatly built, but, for the most part, of one story only. The church stands in an open spot near the *Casa da Camara*. It carries on a trade in mandioca flour, &c. Small vessels from Pernambuco, Bahia, Rio, and the other ports on the east coast, are lying here. An arm of the Peruhipe communicates with the *Caravellas*, affording a passage from Viçosa.* The banks are covered with mangrove-trees, the bark of which is used in tanning, and groves of cocoa-palms.

The *Barra Velha*, "is the old mouth of the River Alcobaça." On its northern bank, not far from its mouth, stands the *Villa de Alcobaça*, built on a white sandy plain. Here, as well as along the whole coast, some trade is carried on in mandioca flour. The ancient forests on its banks are, or have been, inhabited by *Patachoes* and *Machacaries*, who, from this place northward, have peaceably visited the Portuguese settlements, offering wax or game in exchange for necessaries. On the northern bank of this river, several leagues up the country, is the *fazenda of Ponte do Gentio*. At the time of Prince Maximilian's visit, some Indian families resided here, with six families of *Ilhores* (islanders), as the inhabitants of the Azores are called, nine Chinese, some negro slaves, and a Portuguese steward. The Chinese were some of those who were brought to Rio by the *Conde de Linhares*.

There are several other *fazendas* in this neighbourhood, on the right bank of the river; but, from an eminence which commands the village, the whole country presents the appearance of uninterrupted forests.

Five leagues to the north of the Rio Alcobaça, or Itanhen, the Rio do Prado, or Sucurucu (written by Casal, Jucurucu), falls into the Atlantic. The *Villa do Prado*, originally a settlement of Indians, has a little coasting trade with *farinha* (mandioca flour), a little sugar, and other produce.† The river has a bar which is passed by loaded sumacas.

The coast north of Prado exhibits cliffs of clay resting on a ferruginous

* Mr. Lindley says, that the River Caravellos (or of caravels, an ancient three-mast vessel), "has a formidable and dangerous bar, that will admit vessels of twelve feet only; but, when over the bar, they have ten fathoms water."

† While detained by heavy rains in this "dreary, sandy spot," Prince Maximilian saw numbers of *Patachoes*, who, as well as the *Machacaries*, inhabit the forests on the Sucurucu. They are thus described:—

"They entered the town stark naked, with their arms in their hands, and were immediately surrounded by a crowd of people. They brought large balls of black wax for sale, and we procured a number of bows and arrows of them, in exchange for knives and red handkerchiefs. These savages had nothing striking in their appearance; they were neither painted, nor otherwise disfigured: some were short, most of them of the middle size, of rather slender make, with large bony faces, and coarse features. Only a few of them had handkerchiefs tied round them, which had been given them on some former occasion. Their leader wore a red woollen cap and blue breeches which he had procured somewhere. Food was their chief desire. Some flour and cocoa-nuts were given to them: the latter they opened very dexterously, with a small axe. In bartering, some of them were very intelligent. They asked chiefly for knives or hatchets; but one of them immediately got a red handkerchief tied round his neck. A cocoa-nut fixed upon a pole, was set

sandstone ; the summits are covered with wood, and numerous valleys have a little stream flowing to the sea through dark-green forests. On all the rocks along this coast, there are shell-fish which afford a purple juice. In some of these valleys are fazendas. To the north of the point of land called Comechatiba, or Currubichatiba,* a day's distance from Prado, the sea is again bordered by high cliffs and rocks, and the route leads over the heights. A league and a half from Comechatiba, is the little River Cahy, which cannot be passed, however, except at ebb-tide : at high water, it is rapid and rough. It flows, like all these rivers, from a dark woody valley. Between three and four leagues further northward, is the mouth of the Corumbao, somewhat larger than the Cahy. At the *barra* are several sandy islands, the haunt of herons and other water-fowl. A league and a half further, the River Cramemoan falls into the sea, on the south bank of which is the little Indian village of the same name, now a military post, called the Quartel da Cunha. In the foreground of the mountains which skirt the open country on the left, is seen the circular white head of the Morro de Pascoal, which serves as a landmark to mariners : it is a part of the Serra dos Aymores. The route again leaves the beach soon after passing the Cramemoan, and ascends, by a steep path, to a dry, elevated campo, called Juassema, the site of a town which was founded by one of the Dukes d'Aveiro, and destroyed by the Aymores.

The next river is the Rio do Frade, a small stream. Cazal makes its *barra* eight miles north of the Cramemoan. Canoes can proceed two days' journey up the stream, the banks of which are fertile. Monte de Pascoal is seen at a distance of twelve leagues to the west. Three leagues further is the mouth of a rivulet, formerly called Itapitinga. Here, what was formerly a convent of Jesuits, is now a church. The town contained, in 1813, about fifty houses and 500 inhabitants, almost all Indians of a dark-brown complexion. They cultivate mandioca and cotton, and some are fishermen. The Bay of Trancozo is described by Mr. Lindley as small and shallow, and the country, he says, is delightful. The distant forests are inhabited by Patachoes.† From this place it is about fifteen miles to Porto Seguro, the capital of the district. Between Trancozo and Porto Seguro (about three miles south of the latter), is a steep morro crowned with the chapel of Nossa Senhora d'Ajuda, near which formerly stood the town of San Amaro.

up at the distance of forty paces, and they were desired to shoot at this mark, which they never missed.

* Their weapons are, in the main, the same as those of the other savages ; their bows are, however, larger than those of any of the other tribes. I measured one of them, and found it to be eight feet nine inches and a half, English measure ; they are made of *airi* wood (*bignonia*)."

* A reef in the sea forms at this place a good harbour.

† " From the Rio do Frade to Villa Prado," says this traveller, " is a long range of neglected coast, intersected by several smaller rivers, and frequented by such numbers of hostile Indians, that travelling on the beach is extremely dangerous." This was in 1802 ; but, in 1816, the people were on such friendly terms with the Patachoes, that they no longer feared them. " The whole coast," Mr. Lindley adds, " is a continuation of reefs, sunken rocks, and shallows ; yet, the neighbouring pilots conduct vessels so skilfully through, that few accidents occur."

The town of *Porto Seguro*, situated at the mouth of the River Buranhem, though it ranks as the first in the district, is less than Caravellas.

The port which has given name both to the town and the district, is formed by a reef, or rather ledge of rocks, that runs out for about a mile, from an extended point of the main, in a direction parallel to the land, presenting a natural mole.

“These rocks are dry at low water, and terminate abruptly, appearing again faintly at half a mile’s distance. The space between is the bar or entrance, over which is twenty feet water at high tides, but inside, it shallows to twelve feet. The last is the average water of the port, except at some distance up, where the river empties itself, and the water is somewhat deeper. The bottom is a fine sand, gradually ascending to a broad beach. In entering the port, the view of the country is delightful. Near the water’s edge is a range of fishermen’s cottages, shaded with the waving cocoa in front, and each having its adjoining orange-ground. On the back of these cots, the native underwood intrudes, and, intersected into numberless paths, forms evergreen groves full of birds of rich plumage, and some of song. To the northward, the land rises up to a steep hill, which is ascended by a winding path, and on its summit stands the (upper) town The principal inhabitants have each their country farm, situated chiefly on the banks of the river, and ranging five leagues from its mouth up to Villa Verde. At these they have plantations of the sugar-cane and mandioca.”

There is, however, but little agriculture, and the greater part of the farinha consumed, comes from Santa Cruz. This, with salt-fish, constitutes the chief subsistence of the population. There belong to the port the little two-masted vessels, called *lanchas*, which sail with great swiftness. The main-mast has a broad, square sail; the mizen mast, which is shorter, has a small triangular one; and they can be set in such a manner, that the vessel runs so close to the wind, when others cannot steer their course. Porto Seguro is stated by Mr. Lindley to be in latitude 16 deg. 40 min. south, longitude 40 deg. 12 min. west.

Several small rivers join the Porto Seguro or Buranhem, which is also called the Rio da Casioeira, in consequence of a fall. The soil on its banks is said to be of great fertility.

Above five leagues (nearly eighteen miles) north of Porto Seguro, the Santa Cruz falls into the sea. It is rather narrower than the Buranhem, but, like the latter, has a good harbour, protected by a projecting reef of rocks against the violence of the sea. Its first name was the Joam de Tyba. The town of Santa Cruz lies near the mouth, on the south bank, at the foot of the hill.

From this place, a fine beach, “as level as a threshing-floor,” extends to the River Mogiquiçaba (or Misiquiçaba), a distance of several leagues. The Mogiquiçaba is less considerable than the Santa Cruz. A plain, five leagues wide, extends northward from the Mogiquiçaba to the Belmonte. About half way is the Barra Velha, where an arm of the river, now dry, once discharged itself into the sea. The Rio Grande de Belmonte (so called to distinguish it from the other rivers of the same name), runs close by the town of Belmonte, and falls into the sea in latitude 15 deg. 40 min. south. At high-water, this large river is rapid, but its entrance is always dangerous, being encumbered

with sand-banks which, even at high-water, render the navigation formidable to the lanchas.

The Villa de Belmonte was originally a town of Christianised Indians, who were settled here not above sixty or seventy years ago. Few, if any, of their descendants are now left.

We can add nothing more to the foregoing sketches of these provinces, of which we can vouch for the authenticity.

CHAPTER XI.

INTERIOR PROVINCES OF MINAS GERAES, MATTO GROSSO, AND GOYAZ.

THE province of Minas Geraes, owes its chief celebrity to its precious metals and diamonds. The country has, besides, many natural advantages for agriculture and for pasturage. Nor can it be asserted that when Pombal projected the foundation of the capital of Brazil in this province, his judgment was altogether wrong: although the magnificent splendour of the Bay of Rio Janeiro, is scarcely paralleled in the scenery of the world. A capital, with mountains guarding it from maritime invasion, and more central with regard to the other provinces of the empire, might certainly have been erected amid the valleys of this province.

Minas Geraes is described as by far the most undulated and mountainous region of Brazil. It is separated from the province of San Paulo and Rio Janeiro by the Serra Mantiqueira. The most elevated part of this chain is called the *Ita Culume*.

On the north it bounds on Bahia and Pernambuco, from which it is separated by the rivers Verde and Carynhenha; on the east, it is bounded by part of Bahia, Porto Seguro, and Espiritu Santo; and, on the west, by Goyaz. Its extreme length from north to south is estimated at about 600 miles, extending from which in latitude 13 deg. to 21 deg. 10 min. south; its breadth is estimated about 350 miles. The climate is described as temperate, compared with others in the torrid zone, owing to the elevation of its table-land. It abounds with rivers and mountain streams, the greater part of which have their sources in the Serra Mantiqueira, and flow into four great drains. The Rio Doce and the Jequitinhonha, which flows into the Atlantic; the San Francisco, which runs for a great distance north; the Rio Grande, or Para, which receives also the Rio das Mortes, flows in a westerly direction.

Minas Geraes is said to have been first explored by an inhabitant of Porto Seguro, in the end of the sixteenth century, who, with a party, ascended the Rio Doce, and discovered some emeralds.

Some Paulistas visited the country, about 1694, and discovered gold. Villa Rica and Mananu were so far inhabited as to be called towns in 1711, Il João del Rey, and Sabara, on the following year, and Villa de Principé, three years after.

Don Lourenzo d'Almeida was appointed the first governor-general of this province in 1720. In 1818, Villa Rica was declared the capital of Minar, Villa Boa that of Goyaz, and Villa Bella of Matto Grosso.

There have been discovered in this province, gold, platina, silver, copper, iron, lead, mercury, antimony, bismuth, fossil-coal, diamonds, emeralds, rubies, topazes, chrysolites, sapphires, agates, aqua-marinas, amethysts, and almost all the precious stones. The agricultural products are, cotton, tobacco, sugar, wheat, maize, mandioc, coffee, indigo. It yields also drugs, such as ipecacuanha, columbo-root, jalap, liquorice, vanilla, various gums, and Jesuit's bark. In 1776 according to the documents quoted by Mr. Southey, the province of Minas Geraes contained 319,769 inhabitants. In 1808, the German traveller, M. Von Eschwege, says, "the population amounted to 433,049; of whom, 106,684 were whites, 129,656 free mulattoes, 47,937 free negroes, and 148,772 negro and mulatto slaves. In 1820, they were computed to be 456,675 free persons, and 165,210 slaves; total, 621,885." "With double the population," says Von Spix, "Minas has three-and-a-half times as many negro slaves, and nine times as many free negroes as San Paulo." The population, as stated in the table which we have taken from Mr. Kidder's work, amounted in 1844, to 760,000 souls, but we are uncertain as to whether this number includes all the slaves; nor does it, we believe, include the aborigines.

We have but little recent information relative to this province which would justify us in adding much to all we have said under the general description of Brazil, excepting what we can glean from Mr. Kidder's sketches. This traveller says, its form is nearly square, and its area about 150,000 square miles; or one-seventh larger than the United Kingdom.

Some parts of Minas resemble Goyaz and Matto Grosso, being still a wilderness, and overrun with Indian tribes. Other districts are among the most improved parts of the empire. One writer has remarked, that if there be one spot in the world which might be made to surpass all others, Minas is that favoured spot. Its climate is mild and healthful; its surface is elevated and undulating; its soil is fertile, and capable of yielding the most valuable productions; its forests abound in choice timber, balsams, drugs, and dye-woods.

Its name signifies the general mines, and gold, silver, copper, and iron, and precious stones are found within its limits. Several of its most valuable gold

mines have been wrought by an English mining company for the last twenty years. This company was organised under Dom Pedro I., in 1825, with an active capital of 200,000*l*. It has rendered great service to the country generally, by introducing the most approved methods of mining, and by giving an impetus to Brazilian industry. The company pay twenty per cent upon its products to the government, and employs a large number of miners from Cornwall; and at Gongo Socco, its principal mine, there is a thriving English village.

The agricultural industry of Minas Geraes consists chiefly of the cultivation of coffee, sugar, tobacco, and cotton. Its soil yields Indian corn in great profusion, and would grow wheat. Upon its *campinas*, or uplands, innumerable herds of cattle, and some flocks of sheep are pastured. Of the milk of the cows is made a species of soft cheese, known as the *queijo de Minas*; the cheeses are about two inches thick, and six or eight in diameter. When fully prepared, cured, they are wrapped in banana leaves and packed in baskets, to be transported to market, like every thing else, on the backs of mules. Immense quantities of this cheese is sent to Rio de Janeiro, and from thence distributed along the coast as an article of food. Some coarse manufactures of cotton are made.

Roads are either wanting, or the few that have been opened are extremely bad. Considerable sums have been wasted in the construction of roads, but no produce can yet be sent to market in a wheeled carriage. The journey from Ouro Preto, the capital, to Rio de Janeiro, a distance of about 200 miles, is only performed on the backs of mules and horses, and in no less time than about fifteen days.

According to official accounts, education in Minas Geraes, is more advanced than in the other provinces. The provincial government has expended large sums for the support of schools.

Provision has been made to maintain 182 public schools. Of these there were recently in operation, ninety-six primary schools for boys, fifteen for girls, and twenty-six Latin schools. About 8000 pupils are registered in these schools. The average attendance was about 6000. There are also a number of private schools: and the majority of the inhabitants are giving their children an education. Several youths have been sent to Europe at the expense of the province, to qualify themselves for normal masters.

Should the projected steam navigation upon the Rio Doce and the Rio de San Francisco ever be carried into execution, the prosperity of Minas Geraes would be greatly promoted.

MATTO GROSSO is a great inland and chiefly wilderness province, bounded by the provinces Para, Goyaz, San Paulo, and the Spanish territories. It is said to contain no less than four climates, and its area is vaguely computed as greater than that of all Germany.

“Nature,” says Cazal, “has partitioned it into three grand districts, of which

two are divided into six smaller ones, which will, perhaps, at some future day, form the limits of the same number of *ouvidorias*, when the increase of its population shall render such a measure desirable. These seven grand divisions are, Camapuania on the south; Matto Grosso proper, Cuyaba, and Bororonia in the centre; and Juruenna, Arinos, and Tappiraquia on the north.

"The larger portion of this province must be considered as *terra incognita*, for the most part in the possession of native tribes. Tippiraquia, so called from the Tippiraque Indians, lying between the rivers Araguaya and Xingu, is nearly unknown. Arinos and Juruenna, named from the rivers which intersect them, are not better known. These rivers unite and form the great Tapajos. Bororonia, which takes the name of the Bororo Indians, is watered by the San Lourenço, and lies between Goyaz and Cuyaba.

"Camapuania, the southern division of the province, takes its name from the River Camapuan; it is described almost universally flat, and a vast portion of the western half is annually submerged by the inundations of the Paraguay, which is stated, to cover, in some parts, more than seventy miles of plain. Its northern limits are a chain of mountains, extending in the thirteenth parallel of latitude, from east to west, from which emanate the Paraguay and its branches flowing to the southward, and the heads of the Tapajos and the Xingu flowing northward. Numerous other rivers have their origin in a cordillera of inconsiderable elevation, running from north to south, and dividing the canton into east and west, denominated the Serra Amambahy. The middle of the northern part of this district is known by the name of Vaccaria, or cattle-plains, 'in consequence of the cattle that were dispersed here, when the Paulistas expelled the inhabitants of the city Xerez, and of five neighbouring small aldeias, which formed a small province, of which the said city was the head."

Of the numerous savage nations, the most powerful are the Guaycurues.

The route to Matto Grosso was formerly from the sea coast, but there has for some time been communications with it from Para by ascending either the Tocantins, the Xingú, the Tapajos, or the Madera rivers.

The distance in a right line from Para to Villa Bella, one of the principal places of Matto Grosso, is about 1000 miles, but at least 2500 miles have to be traversed in making the passage by water. By the Geographical and Historical Institute of Rio de Janeiro, a detailed account of this route has been published.

For the space of 1500 miles up the Amazon and the Madera, to the falls of San Anthony, a powerful current forms the only obstacle. A great part of the country through which the Madera flows is described as very unhealthy. From the falls of San Anthony a succession of falls and rapids occur for more than 200 miles. Canoes and their cargoes overland are carried over *portages* to avoid the falls and rapids, by the most tedious and difficult labour; and, three or four months are occupied in surmounting this difficult part of the route;

above these falls there are about 700 miles of good navigation on the Mamoré and Guaporé Rivers, the whole voyage occupies about ten months by the traders carrying goods. A host of Indians and negroes are required as oarsmen and carriers. It is usual for several companies to associate together, and the enormous quantity of provisions required, occasions great expense and delay. The downward voyage is performed in much less time. Notwithstanding the toil of this long and dreary voyage to Matto Grosso, it is less dreaded than the overland difficult route by the mountains to and from Rio de Janeiro.

Matto Grosso signifies a dense forest, a not very imperfect description of this vast region. The province is sometimes called Cuiabá, after a river which runs through it. The bishopric which it constitutes is known by that name only.

Mr. Kidder says, Matto Grosso lies nearer the centre of South America. It contains over 500,000 square miles, while its population does not, by the largest estimate exceed 40,000, or one inhabitant for each area of twelve square miles. Sixty-six different tribes of Indians still exist in the province. Most of these tribes are in an entirely savage state. A few of them are on friendly terms with the government and people of the province; others are decidedly hostile, and omit no opportunity of making desolating incursions upon the cultivated districts. Extending through seventeen degrees of latitude, the climate of this province is considerably varied. It is generally considered healthy. Although mountainous throughout, it has no volcanoes, nor any peaks which for height can be compared with those of the Andes.

It abounds in deep caverns and magnificent cataracts. Two of its caverns have been explored and described at some length. One of them has been called the Gruta das Onças, from the great number of wild beasts that inhabited it. The other is called Gruta do Inferno, or the Grotto of Hell.

Its soil, which must be exceedingly varied, is said to be generally fertile. In some parts considerable attention is given to grazing, but generally speaking, the inhabitants make no exertions to produce any thing that is not requisite for their immediate consumption. The province abounds in gold and diamonds, but owing to the lack of skill employed in searching for them, the products of either, in latter years, have been very small. What is gained by the miners and the garimpeiros, as the diamond seekers are called, together with small quantities of ipecacuanha, constitute the whole amount of exports from the province. These articles are generally sent to Rio de Janeiro, where they suffice to purchase the few manufactured goods that are used by the inhabitants of Matto Grosso.

Cuiabá, the capital of the province, is situated on a healthy ground near the River Cuiabá. It is, in fact, little more than a village. Its houses are nearly all built of taipa, with floors of hardened clay or brick. The region immediately surrounding it is said to be so abundant in gold, that some grains of it may be

found wherever the earth is excavated. It is about 100 miles from the diamond district.

The first printing-press in Matto Grosso, was brought to it at the expense of the government in 1838. The number of primary schools provided for by the government is eighteen. Eight of these were, in 1843, supplied with teachers, having 434 boys on their lists. The number of scholars in private and Latin schools, at the same time, was about 200. Great inconveniences were suffered from the lack of books, paper, and nearly every other material essential to elementary education. In addition to this low state of education, that of religion appears, from the reports of successive presidents of the province, to be still worse. There are but few churches, and not more than half of these have priests.

GOYAZ, so called from the aboriginal nation Goya; occupies the central parts of Brazil, east of Matto Grosso, and is very similar in its natural and present condition, soil, productions, and climate, to the latter. It extends from Para, on the north, to San Paulo, on the south. Its eastern boundaries are Maranh, Piahy, Pernambuco, and Minas Geraes. Goyaz was early discovered by the Paulistas, in their search for mines and capturing of slaves. It is described as abounding in gold, diamonds, and precious stones, but its remoteness from the sea, and its want of roads and navigable rivers, are obstacles to those prospects to which its resources are otherwise adapted.

Goyaz is not generally mountainous, but its surface is elevated and undulated. Magnificent forests grow on the banks of its rivers, but the greater portion of the province is covered with low and stunted shrubbery of the same kind as prevails in the province of Minas, and known by the name of *catingsas* and *caracuenos*. Its soil yields the usual productions of Brazil, together with many of the fruits of southern Europe. Cultivation has been greater in Goyaz than in Matto Grosso, but it is still in a very rude and limited state.

The Goyas are now nearly extinct, but other tribes still live within it, and some of them cherish a deadly hatred to the people who have invaded and disturbed them. Settlements are said to be often laid waste by their hostile incursions, and regular troops are constantly under arms to resist them.

Lately mineral waters have been discovered in Goyaz. Several warm springs are said to exist in the south-western part of the province.

M. Auguste St. Hilaire and General Raymundo Jozé da Cunha Mattos give us some statements relative to this province. Both of them travelled extensively within its boundaries, and both agree in representing the state of society as backward in the extreme. The *vaqueiros*, or cattle proprietors, possess vast herds of horned cattle, and their principal business is to mark, tend, and fold them. They understand the use of the lasso, and also of the long knife, but their moral and intellectual condition is deplorable. St. Hilaire remarks, that "the people who

become domesticated in these vast wilds, seem to lose the very elements of civilisation. By degrees their ideas of religion, and their respect for the institution of marriage, disappear. They learn to dispense with the use of money as a circulating medium, and to forego the use of salt upon their food." But this is not all—"a species of brutish infidelity is already disseminated throughout these sertoes, which, it is to be feared, will end not only in degrading the people below the ordinary rank of moral and civilised society, but even below the condition of the aboriginal Indians."

Goyaz and Matto Grosso were originally settled by gold hunters. The lure of treasure led adventurers to bury themselves in the deep recesses of these interminable forests. Their search was successful. "Gold was so plentiful, that for the first year every slave commonly returned three and often four ounces a day. It lay upon the very surface of the ground. But the thoughtless adventurers had made no provision for supporting themselves in the wilderness, and they discovered, when too late, that food was more precious than gold. A few white deer were the only game they could find, and mangabas the only fruit. Higher prices for provisions have seldom been demanded in a besieged town, or during extreme famine, than these poor miners were glad to pay. A pound of gold could scarcely buy a bushel of corn, and in one instance a pound of gold was bartered for a pound of salt. A drove of cattle arrived, and flesh and bone together were sold for an ounce and a half of gold per pound. The gold which they gathered was expended for food, but all was not enough, and many of them died of starvation.

"The time when gold was most abundant, was described by one of the survivors as a season of pestilence and famine; and the discoverer himself, who counted his gold by *arrobas*,* died of leprosy. In later times gold has become scarcer, but the march of improvement has been slow, and notwithstanding the ardent anticipations of Mr. Southey and some others, the day is likely to be distant when these regions will either be populous or highly enlightened."

Mr. Kidder says, the presidential reports of Goyaz state the number of primary schools in that province to be sixteen for boys and two for girls. There existed at the same time five or six schools of a higher order, and the number of pupils attending them is about one thousand. The provincial government has, within a few years, imported a printing-press, which is chiefly employed in printing official documents. The condition of the mechanical arts in these two provinces may be inferred from statements made in the report of the minister of the empire in 1844.

"It is scarcely possible to find persons who have any skill in the common mechanical trades; none whatever in comparison with the wants of the country, Eight French mechanics were recently on their way to Matto Grosso. As they

* A weight of thirty-two pounds.

passed through Goyaz, the provincial government induced three of them, a carpenter, a cabinet-maker, and a blacksmith, to establish themselves within its bounds; and this event was deemed so important, as to be officially stated in the president's message to the next provincial assembly." The minister of the empire significantly remarks, that from such particulars, some idea may be formed of the actual state of things in general.

SANTO PAULO.—This province is divided from the province of Rio on the north-east, by a line which, traversing the heights of the vast Serro from the point of Joatinga to the head of the Jacuy, descends that river till it joins the Parahiba. The serra of Mantiqueira separates it from Minas Geraes on the north, the Rio Grande and the Paranna from Goyaz and Matto Grosso on the west and north-west; the Sahy from San Catherina on the south; and on the east it has for its boundary the Atlantic. Its territory is almost all within the temperate zone, between 20 deg. 30 min. and 28 deg. south latitude, comprising 450 miles, from north to south, and 340 miles of medium width. Except in the eastern part, where a *cordillera*, or elevated ridge of mountains, runs parallel with the coast, this province is not mountainous. None of the maritime provinces, with the exception of Para, contain so many navigable rivers; but all these, excluding only the few streams or mountain torrents which descend the eastern declivity of the cordillera, flow west into the interior, and fall into the Paranna, so that they afford little facility as outlets to commerce.*

"The accounts of earlier historians," says Dr. Von Spix, "describe the Paulistas as a lawless tribe, resisting every legitimate constraint of custom and moral feeling, who, for that very reason, had renounced the dominion of Portugal, and formed a separate republic. This opinion was caused also by the reports of the Jesuits, who certainly had good grounds at that time to be discontented with the conduct of the Paulistas. Subsequently to the year 1629, the latter frequently made incursions into the Indian colonies of the Jesuits in Paraguay, and with incredible cruelty carried off all the natives as slaves. These plundering excursions, as well as their enterprises in search of gold to Minas, Goyaz, and Cuiabá, gave to the character of the Paulistas of that time a selfishness, rudeness, and insensibility, and inspired them with a disregard for all relations consecrated by law and hu-

* The city of San Paulo, which gives its name to the province, is the oldest in Brazil, and above every other interesting in an historical point of view. "Here, more than in any other place," says Dr. Von Spix, "we find the present connected with the past. The Paulista is sensible of this, and says, not without pride, that his native city has a history of its own." The celebrated Anchieta and his brother Jesuits commenced this city in the year 1552, with the foundation of a college, in which they celebrated the first mass on St. Paul's Day. When, six years after, it acquired the denomination of a town, its name was determined by this circumstance. Its first inhabitants were a horde of Guayana Indians under their cacique, Tebireca, who had resided in the *aldeia* of Piratinin, near the small river of that name, not far from the new colony, which, in consequence, took the name of San Paulo de Piratininga. The Indians were soon joined by a great number of Europeans, and a mixed race rapidly augmented the population; so that, before a century had elapsed, the Paulistas had become formidable by their numbers, as they were distinguished by their spirit of enterprise.

manity, which naturally drew upon them the severest reprobation of the fathers, who were animated with enthusiastic zeal for the welfare of mankind.*

This republican character is, however, now softened, and the Paulista enjoys, throughout Brazil, the reputation of great frankness, undaunted courage, and a romantic love of adventures and dangers.†

Mr. Kidder recently visited this province. He proceeded by a steam-packet to Santos. On entering the river of the latter, the packet was met by boatmen.

"Their principal employment," he says, "is to go on board the vessels as they pass up and down, to serve as a guard against smuggling. The course of the river is winding, and its bottom muddy. Its banks are low, and covered with mangroves."

Passing up the river, he first came in sight of a few houses on the left, called Villa Nova. Soon after, on the opposite side, appeared Fort Itipema, an old fortification much dilapidated, and whose only garrison was a single family. Next became visible the masts of twenty or thirty vessels lying at anchor before the town, which is upon the southern or left bank as we ascend. On arriving, he was boarded by a port officer in regimentals. His visit was one of mere ceremony, as he did not demand the passports, but his letters. The passage from Rio de Janeiro occupied about forty-eight hours, rather more than the usual time.

Santos, the harbour of San Paulo, is built on the southern shores of the Island of San Vincente, and has a safe harbour of easy access, about 8000 inhabitants, and trades with Rio de Janeiro, Pernambuco, Ceara, and Maranhão. Several European vessels enter it annually. San Sebastiao, on the island of the same name, has 5000 inhabitants, and exports timber and grain. Iguape, further west, has a good harbour, with about 6500 inhabitants, and exports rice and timber.

* The Paulistas, although they did not designate the domestic Indians by the appellation of captives, or slaves, but by that of *administrados*, disposed of them as such, giving them to their creditors in payment of debts, and by way of dowry on occasions of marriage. The Jesuits, who possessed or had the control over a great number of Indians, and under whose power they received the denomination of *administrados*, without any consequences of slavery being attached to the term, declaimed against the abuses practised by the Paulistas, and demonstrated to them the impropriety of usurping a right to dispose of the liberty of the Indian. The Paulistas, who were opulent, and owed all their wealth to the arms of their numerous *administrados*, determined to repel the Jesuits, in order that the truths which they promulgated should not militate against their interests."—*Henderson's History of Brazil*.

† "It is true," says Dr. Von Spix, "that in conjunction with these commendable qualities, a propensity to anger and revenge, pride and stubbornness have, remained in his character, and he is therefore feared by his neighbours; the stranger, however, sees in his haughty manner, only earnestness and an independent spirit; in his good-natured frankness and hospitality, an amiable feature; in his industry, the activity that marks the inhabitants of a temperate zone; and has less occasion than his neighbours to become acquainted with his faults. The only excuse for his pride is, that he can boast of having a claim, through the actions of his forefathers, to this new continent, which the settlers from Europe cannot adduce. There is no manner of doubt that the first comers contracted frequent marriages with the neighbouring Indians, and the complexion and physiognomy of the people indicate the mixture here, more than in the other cities of Brazil, for instance, in Maranhão and Bahia. Many whites have, however, at all times settled here; and many families of Paulistas have preserved themselves without mixture with the Indians; these are as white, nay, even whiter, than the purer descendants of the Europeans in the northern provinces of Brazil.

On proceeding to the interior he observes, it is necessary to premise, that not only rail cars, but also stage coaches, and all other vehicles of public conveyance, are entirely unknown in the country, owing, in a great degree, at least, to the unsuitable character of the roads. All who do not walk must expect to be conveyed on the backs of mules or horses, and to have their baggage transported in the same way. For long journeys, the former are generally preferred. But it frequently happens at Santos that neither can be hired in sufficient number without sending to a considerable distance. Although scarcely a day occurs in the year in which more or less troops of mules do not leave that place for the upper country, yet the greater part of those animals are totally unfit for riding, being only accustomed to the pack-saddle, and having never worn the bit. It may be here remarked, that ordinary transportation, to and from the coast, is accomplished with no inconsiderable regularity and system, notwithstanding the manner. Many planters keep a sufficient number of beasts to convey their entire produce to market; others do not, but depend more or less upon professional carriers. Among these each troop is under charge of a conductor, who superintends its movements and transacts its business. They generally load down with sugar and other agricultural products, conveying, in return, salt, flour, and every variety of imported merchandise. A gentleman who had for many years employed these conductors in the transmission of goods, told him he had seldom or never known an article fail of reaching its destination.

On leaving Santos, he says, "The first characters that engaged my attention were the two tropeiros, or conductors of the troop. They were not mounted, but preferred going on foot, in order to give proper attention to their animals and baggage:

"The road was level as far as Cubatão, leading along the river, and twice crossing that stream by bridges. The principal house of the village mentioned was the Registro: where, in addition to paying a slight toll, each passer-by had his name and nation registered. A short distance beyond Cubatão we commenced ascending the Serra do Mar, or Ocean Cordillera. This range of mountains stretches along more than 1000 miles of coast, sometimes laved at its very feet by the ocean; at others branching off inland, leaving a considerably wide range of low and level interval, called by the Portuguese, Beira Mar.

"The road leading up the Serra do Cubatão, is one of the most expensive and best wrought in Brazil. Yet owing to the steepness of the ascent, it is utterly impassable to carriages. It embraces about four miles of solid pavement, and upwards of 180 angles in its zig-zag course.

"A solid pavement up this mountain pass was rendered essential from the liability of the road to injury by the continued tread of animals, and also from torrents of water which are frequently precipitated down and across it in heavy rains. Notwithstanding the original excellence of the work, maintained as it had been by frequent repairs, we were obliged to encounter some gulleys and slides of earth

which would have been thought of fearful magnitude had they not been rendered insignificant in comparison with the heights above, and the deep ravines which ever and anon yawned beneath precipitous embankments. At these points, a few false steps of the passing animal would have plunged both him and his rider beyond the hope of rescue. Our ascent was rendered more exciting by meeting successive troops of mules.

“Through openings in the foliage, we had repeated opportunities of viewing the country below, skirted by the ocean. The Jesuit Vasconcellos, who had performed the ascent about 200 years before, thus describes the pass, and the description, it is said, will still hold true with the exception of the last sentence, which makes the elevation too great.

“‘The greater part of the way you have not to travel, but to get on with hands and feet, and by the roots of trees; and this among such crags and precipices, that I confess my flesh trembled when I looked down. The depth of the valley is tremendous, and the number of mountains, one above another, seems to leave no hope of reaching the end. When you fancy you are at the summit of one, you find yourself at the bottom of another of no less magnitude. True it is, that the labour of ascent is recompensed from time to time; for when I seated myself upon one of these rocks, and cast my eyes below, it seemed as though I was looking down from the heaven of the moon, and that the whole globe of earth lay beneath my feet. A sight of rare beauty for the diversity of prospect, of sea and land, plains, forests, and mountain tracks, all various, and beyond measure delightful. This ascent, broken with shelves of level, continues till you reach the plains of the Piratininga, in the second region of the air, where it is so thin, that it seems as if those who newly arrive could never breathe their fill.’

“From the summit of the serra, which is 2250 feet above the sea, the distance to San Paulo is about thirty miles, over a country diversified with undulations, of which the prevailing declination by the course of streams is inland. Nevertheless, so slight is the variation from a general level, that the highest point within the city of San Paulo, is estimated to be in precisely the same altitude with the summit mentioned. No inconvenience could therefore be experienced from rarification of the atmosphere at such an elevation.

“The soil here is occasionally sandy, and frequently mingled with ferruginous sandstone, partially decomposed. At other points a reddish marl predominates. The general appearance of the country resembles the oak openings of the western states of North America, being interspersed with prairies; although the character of the vegetation is entirely different, and is also much varied from the region below. One decided peculiarity of the uplands of San Paulo, consists in their prairies being dotted with ant-hills. The earth composing the outer crust of these insect habitations, becomes so perfectly indurated between rain and sun, as to retain the erect and oval form originally given it, for scores of years.

"The rain ceasing, we proceeded as far as Rio Pequeno (Little River), and made a halt at a rancho upon its banks. The ordinary rancho is a simple shed, or rather a thatched roof set upon posts, entirely open below. It is built expressly for the accommodation of travellers, and its size corresponds to the public spirit of the neighbourhood. Sometimes a rancho is from sixty to 100 feet long, and proportionally wide. Occasionally one may be found enclosed. Those who first come are entitled to their choice of position. They unlade their mules, and pile up their saddles and cargo, frequently constructing a hollow square, within which they sleep, either upon skins extended on the ground or in hammocks. Their beasts are turned out to graze for the night; and as each troop ordinarily carries such culinary apparatus as its company requires, they have abundant leisure for preparing food while their animals are resting.

"Frequently, for the sake of securing better pasture, the tropeiros encamp in the open air. They then pile up their panniers of sugar, coffee, or other cargo, in a right line, cover them with hides, and dig a trench around them in order to prevent injury from any sudden shower."

The fact, that the great majority of all who travel in the interior of Brazil prefer arrangements of this kind, may account for the scarcity of better accommodation.

The latter part of his route led over a pleasant rolling country, but thinly inhabited. The road, although simply a beaten track, not designed for carriages of any description, has been found to need frequent repairs, from the throng of laden mules that are constantly passing over it. A party of Germans, just arrived, were thus employed. The rest were chiefly mulattoes and Indians.

"It would be expected in the absence of carriages, that unless females were absolute 'keepers at home,' they would become expert in riding. We accordingly had repeated opportunities of witnessing their dexterity in managing the rein and stirrup. We could hardly persuade ourselves to admire their style of riding, notwithstanding their skill, and the fleetness of their horses; yet in the destitution of side-saddles, it would be difficult to suggest a better. Men's hats seemed to be in fashion with them, both in riding and walking."

The troops, or caravans, so often met on this route, are composed of from 100 to 300 mules each, attended by a sufficient number of persons. The mules have each a pack-saddle, bearing upon each side well-balanced panniers, containing bags of sugar, or other goods. One is trained to take the lead, and is selected on account of experience on the roads. Its head is often adorned with sea-shells and plumes of peacocks' feathers. It has a bell suspended, and then takes the lead. The conductor of each troop is well mounted, and with a lasso, is ready to pick up any animal that attempts to stray away.

Passing through the plains of Ypiranga, he soon came in sight of San Paulo, and passed up a narrow street into that ancient city.*

* "Proceeding to the only house where public entertainment could be expected, I was soon

The city of San Paulo is situated between two small streams, upon elevated uneven ground. Its streets are narrow, and not laid out with regularity. They have narrow side-walks, and are paved with ferruginous conglomerate closely resembling old red sandstone.

Some of the buildings are constructed of this stone; but the material more generally used in the construction of houses is the common soil, slightly moistened, built up into a solid wall. These walls are usually very thick, and are generally covered by projecting roofs, which preserve them from the rains. Walls of this kind have been known to stand more than 100 years, without the least protection.

The houses within the city are generally two stories high, and constructed with balconies, sometimes with, and sometimes without lattices. These balconies are the favourite resorts of both sexes in the coolness of the morning and evening, and when processions are passing through the streets.*

In the suburbs and vicinity of San Paulo there are many handsome houses and gardens. This town is a rendezvous for the province. Many of the more wealthy planters who have houses in the city, spend only a small part of their time on their estates. They direct in the city the sale and disposal of their produce, as it passes down the serra to market.

Near the town is the botanical garden, established about thirteen years ago. It is laid out in good taste, with shaded walks, and has a tank of pure water. It is rather neglected, from a want of funds.

There are twelve churches in the city of San Paulo. The cathedral is large, and in it some twenty ecclesiastics chant high mass. A considerable number of persons, chiefly women, were present.

arranged in comfortable lodgings. This house was kept by one Charles, a Frenchman, married to a Portuguese wife, and for many years a resident of the place. I found that almost every preceding traveller, from whatever nation, had been entertained by him. This experience of Monsieur Charles had led him to an unusual degree of caution respecting his guests. His rule was, to admit none without a letter of introduction. A gentleman, acquainted with this regulation, had favoured me with the necessary note."

* "The houses of Brazil, whether constructed of earth or stone, are generally coated outside with plastering, and whitewashed. Their whiteness contrasts admirably with the red tiling of their roof; and one of its principal recommendations is the ease with which it can be re-applied in case of having become dull or soiled. In San Paulo the prevailing colour is varied in a few instances with that of a straw yellow, and a light pink. On the whole, there appeared a great degree of neatness and cheerfulness in the external aspect of the houses in San Paulo.

"There is a considerable variety in their general plan; but almost all are so constructed as to surround an area, or open space within, which is especially useful in furnishing air to the sleeping apartments, and is rendered the more indispensable by the custom of barring and bolting, with heavy inside shutters, all the windows that connect with the street. In cities, the lower stories are seldom occupied by the family, but sometimes with a shop, and sometimes with the carriage-house or stable. The more common apartments above, are the parlour and dining-room, between which, almost invariably, are alcoves designed for bed-rooms. The furniture of the parlour varies in costliness according to the degree of style maintained; but what you may always expect to find, is a cane-bottomed sofa at one extremity, and three or four chairs arranged in precise parallel rows, extending from each end of it towards the middle of the room. In company, the ladies are expected to occupy the sofa, and the gentlemen the chairs.'

Among the prevailing fruit-trees here, is the Jaboticabeira in great abundance. This tree belongs to the order of Myrtaceae, and exhibits the great singularity of bearing its flower and fruit directly upon the trunk and large limbs, to which they are closely attached, while the extremities are covered with dense green foliage. The fruit is highly delicious, resembling in appearance the large purple grape.

The *campos* may be denominated prairies or openings, and in which rare plants abound. Among the variety, the *tibou* is extremely fatal to cattle, and they die without remedy soon after eating it.

Education in San Paulo.—The Academy of Laws, or, as it is frequently denominated, the University of San Paulo, ranks first among all the literary institutions of the empire. The secretary and acting president, Doctor Brotero, has published a standard work on the "Principles of Natural Law," and a treatise upon "Maritime Prizes."

The edifice of the *Curso Juridico*, was originally constructed as a convent by the Franciscan monks, whom the government compelled to abandon it, for its present more profitable use. Being larger and well built, a few alterations rendered it suitable to the purposes for which it was required. The lecture-rooms are on the first-floor, the professors' rooms and library on the second; these, together with an ample court-yard and two immense chapels, compose the buildings. In one chapel are several paintings. Both abounded in images and painted representations of the patron saint. The library of the institution, containing 7000 volumes, is composed of the collection formerly belonging to the Franciscans, a part of which was bequeathed to the convent by the Bishop of Madeira; the library of a deceased Bishop of San Paulo, a donation of 700 volumes from the first director, and some additions ordered by the government. It was not overstocked with books upon law or *belles lettres*, and was quite deficient in the department of science. There was a superabundance of unread and unreadable volumes on theology.*

In its arrangement, the University of Coimbra was followed as a model for this. The education imparted by it may be formal and exact in its way, but

* The Academy of the Legal and Social Sciences of the city of San Paulo, was created by a law, dated August 11, 1827. It was formally opened by the first professor, Doctor Jozé Maria de Avellar Brotero, on the first day of March, 1828—Lieutenant-General Jozé Arouche de Toledo Rendon being first director.

The statutes by which it is governed were approved by law, November 7, 1831.

The studies of the preparatory course are Latin, French, English, rhetoric, rational and moral philosophy, geometry, history, and geography.

The regular course extends through five years. The several professorships are thus designated:

First Year.—1st. Professorship Natural and Public Law, Analysis of the Constitution of the Empire, Laws of Nations and of Diplomacy. Second Year.—1st. Continuation of the above subjects; 2nd. Public Ecclesiastical Law. Third Year.—1st. Civil Laws of the Empire; 2nd. Criminal Laws—Theory of the Criminal Process. Fourth Year.—1st. Continuation of Civil Law; 2nd. Mercantile and Maritime Law. Fifth Year.—1st. Political Economy; 2nd. Theory and Practice of General Law, adapted to the code of the Empire.

can never be popular. The Brazilian people regard utility more than the antiquated forms of a Portuguese University.

The number of students, from year to year, has been, 1828, 33; 1829, 114; 1830, 213; 1831, 270; 1832, 274; 1833, 267; 1834, 221; 1835, 175; 1836, 178; 1837, 94; 1838, 63; 1839, 60; 1840, 53; 1841, 59; 1842, 61; 1843, 65.

Excursion to the Interior.—Mr. Kidder travelled inland. He says, “The route was greatly diversified, between hill and dale, but did not often give an extended prospect. Indeed, each successive turn of our winding way seemed to take us deeper into a vast labyrinth of vegetable beauty, only here and there touched by the hand of cultivation. The palm-tree, in any of its numerous varieties, is a peculiar ornament to a landscape. Two single species prevailed throughout this section. One shot directly upward, a tall, slender, and solitary trunk, without leaf or flower. The other, growing to the length of from sixty to ninety feet, gradually tapered from the base to the extremity, until it reached the minuteness of a thread, throwing out at each joint a circle of leafy tendrils, which sometimes caught the branches of other trees for support, and sometimes waved pendulous and gracefully, forming every imaginable curve in the air. There were also the golden rochysia, bignonias of various hues, and now and then an immense tree, a veteran of the forest, decked with blossoms as bright and gay as the first dress of the primrose in spring.

JARAQUA.—“Although containing two or three thousand people, and receiving its principal importance from being a central point for business, the place contained but one inn or estalagem, and that was a small house some distance from the street, with much more of a private than public appearance. The master of the house was absent, and I saw none of its inmates save negroes and children. The key of my apartments was sent out, by means of which I was soon introduced to a place having neither floor nor window, and which, but for the door that opened before me, would have been unvisited by either air or light. However, there was room to turn round, and to stow away our saddles and portman-teaux, and in a recess hard by I discovered a bed. Supper was sent in anon, consisting of chicken broth and boiled rice.

“The next morning was delightful, the sky bright, and the air fresh, although the sun on appearing rapidly gained strength. Our route led through a nearly level forest of four leagues in extent, beyond which there appeared clearings and cultivated grounds. During the day I passed the only saw-mill I observed anywhere in Brazil; all forms of timber being ordinarily cut by the slow and toilsome process of the hand or cross-cut saw. Several features in the general aspect of the country, more than usually resembled the appearance of things in the United States.

“The variety of birds that enlivened our route was greater than common. The

pomba and pombinha de rola species of mourning doves, were most frequently seen; while the uraponga, thus named in imitation of its note, was constantly heard. I will here remark, notwithstanding the extravagant accounts which some writers have given respecting the inhabitants of a South American forest, that while travelling very extensively in that country, in different latitudes, I found both birds and animals much more rare than they are throughout the United States. Squirrels of no species appear, and the most that a traveller will have seen, in ordinary circumstances, throughout a day's ride, will have been a monkey or a flock of paroquets. The apparent absence of game, however, may be in part owing to its extreme wildness, for monkeys are often heard howling at a distance.

"The soil over which we passed was but little diversified, constantly resembling the red marly alluvial of San Paulo. We reached the villa of San Carlos, at which I was most hospitably entertained by a gentleman to whom I bore letters of introduction. This town is on the border of a vast series of level plains, sweeping inland. The road over which I had passed from the coast was only suitable for beasts, but from this place transportation could be effected by carts or waggons for a distance of near 300 miles.

"As a matter of course, this place had become a great rendezvous for muleteers, who conveyed the sugars of the interior hence to the sea-coast, and brought back salt and other commodities in exchange. Troops might be seen loading and unloading every day."

CHAPTER XII.

PROVINCES OF SANTA CATHARINA AND OF RIO GRANDE DO SUL.

SANTA CATHARINA.—In 1796, this province was computed to contain 1246 *fogos* (fires or hearths, that is, houses), and 23,865 adult inhabitants, exclusive of troops. In 1812, the population, according to Cazal, amounted to 31,530. In 1844, there were, by official returns, 53,707 free inhabitants, and 12,511 slaves. The province has three towns—Nossa Senhora do Desterro on the Island of Santa Catharina, San Francisco on the island of the same name, and Laguna on the continent; and seven *freguezias* or parishes—three on the island, and four on the continent.

The inhabitants of these provinces devote their time more to the breeding of cattle than to the cultivation of the soil. They are also engaged in the fisheries along the coast and in the lagoons.

The island of Santa Catharina is mountainous. The province of Santa Catharina is the smallest in Brazil. It comprehends the island from which it takes its name, and an extent of about 200 miles of sea-coast. The capital, which is called Nossa Senhora do Desterro, is situated upon the north-western extremity

of the island, and is but a small town, although its harbour is compared with that of Rio de Janeiro for excellence and beauty.*

It is well supplied with good water. The verdure, the orange trees, and houses generally well built, render the place refreshing and picturesque.

Its natural advantages are great, but its trade is inconsiderable; and is covered with forests and fields of pasturage. The climate is temperate, and most of the trees and fruits of Europe will grow in perfection. It is often visited by invalids. Flax is grown in the neighbouring country, of which coarse linen is made, and cotton and thread are often woven together. Jars, water-pots, and other vessels are made of the red clay of the interior.

Among the shells abounding on the coast, there is a species of *Murex*, from which a beautiful crimson colour is extracted. The butterflies are splendid. Langsdorff says, "They are not like the tame and puny lepidoptera of Europe, which can be caught by means of a small piece of silk. On the contrary, they rise high in the air, with a brisk and rapid flight. Sometimes they light and repose on flowers and the tops of trees, and rarely risk within reach of the hand. They appear to be constantly on their guard, and if caught at all, it must be when on the wing, by means of a net at the extremity of a long rod of cane. Some species are observed to live in society, hundreds and thousands of them being sometimes found together. These generally prefer the lower districts and the banks of streams. When one of them is caught and fastened by a pin on the surface of the sand, swarms of the same species will gather round him, and may be caught at pleasure.

Mines of coal are said to exist within this province, but no satisfactory discoveries have yet been made. Doctor Parigot, who was employed to make surveys in the province in 1841, "reported the existence of a carboniferous stratum, from twenty to thirty miles in width, and about 300 in length, running from north to south through the province. The best vein of coal he opened he pronounced half bituminous, and situated between thick strata of the hydrous oxide of iron and bituminous schist."

Oranges, pine apples, and various fruits are described as delicious. Mandioc, flax, cotton, rice, maize, some wheat, &c., are cultivated. The whale and other fisheries are carried on near the shores, and in the bays and lagoons, and this small and fertile province requires only industry and a larger population to render it an earthly paradise.

THE PROVINCE OF GRANDE DO SUL is described as healthy, and abounds in

* Commodore Anson touched here in 1740, the place having become of more consequence, and the authority of the government being increased in proportion, the inhospitable system established in other parts of Brazil, had been introduced there also. A great contraband trade was then carried on from this island with the Plata, the Portuguese exchanging gold for silver, by which traffic both sovereigns were defrauded of their fifths. Fortifications were then being erected. In 1749, the population of Santa Catharina had increased to 4197; but about the end of the century, several thousands were carried off by a contagious disease, which appears to have been dysentery with putrid fever.

natural advantages. It has for a long time past been involved in a rebellion which has nearly destroyed its prosperity. One result of this continued revolution has been the almost entire extinction of slavery within the contested territory. In order to increase their ranks, the revolting party promised, from time to time, liberty and arms to every slave of a legitimist who would desert his master, and the government likewise promised the same to those slaves who would desert the revolters; and, by a summary act, deprived all the rebels of the legal right to hold slaves. Thus, between the two parties, the slaves are declared free, although it is possible that many on both sides will, by some means, be kept in ignorance of the privilege.

The proximity of Rio Grande to the Spanish Republics on the south and west, brings the inhabitants into intercourse with those of the latter; which no doubt engenders a republican spirit. The population of Rio Grande has intermixed with that of the neighbouring states.

The appearance and character of the inhabitants of Rio Grande partake of the circumstances there pursued. They are described as generally tall, of an active and energetic appearance, with handsome features, and of a lighter skin than prevails among the inhabitants of the northern provinces of Brazil. Both sexes are accustomed from childhood to ride on horseback, in which they acquire great skill; they take their amusements, as well as perform their journeys, and pursue the wild cattle of their plains on horseback. The use of the lasso is learned from boyhood, and is managed with almost inconceivable dexterity. Little children, armed with their *lasso* or *bolas*, make war upon chickens, ducks, and geese of the poultry farm-yard, as preparatory to bolder attempts.

For the pursuit of wild cattle, horses are admirably trained, so that when the lasso is thrown they know precisely what to do.

A province so extensive, and so conveniently situated, as that of Rio Grande do Sul, possesses the greatest advantages, and many harbours. Pasturage is the most general means of the inhabitants. There are several towns.

Up to the year 1763, the provincial capital was San Pedro do Sul, or Rio Grande, its harbour, which forms the entrance to the Lagoa dos Paros is improperly termed a river.

PORTO ALLEGRO, or PORT ALEGRE, is situated near the mouth of the River Jacuhy, and is said to be well built, and to contain about 10,000 inhabitants. Vessels are built, and some trade carried on with the sea and with the interior. Sao Leopoldo, north of it, is described as a thriving place, with about 5000 inhabitants. Francisco de Paula, inland to the north, has been chiefly a place for preparing jerked beef.

If this province were only restored to tranquillity, its pastures, soil, and other resources would with an industrious and intelligent population, render it susceptible of great prosperity.

CHAPTER XIII.

PROVINCE AND CITY OF RIO DE JANEIRO.

THIS province, Rio de Janeiro, derives its name from its port, falsely called Rio de Janeiro : for it is not a river but a magnificent inlet of the sea, and with only a few insignificant streams flowing into it, bounded on the north by Espiritu Santo, and by Minas Geraes. On the west it borders on San Paulo ; and on the south and the east it has the Atlantic Ocean. It comprises about half of the original capitania of San Vincente, together with a portion of territory formerly belonging to Espiritu Santo. It is estimated to be sixty leagues in length from east to west, near its northern extremity, and fifty near its southern, and to be about twenty-three leagues of average breadth.

We have various accounts of this province, but little that we can rely upon of recent date, except the sketches of Mr. Kidder, and the official returns of trade which will be found hereafter.

The Serra dos Orgoas, organ mountains, so called on account of the resemblance which the pyramidal heads bear, in various parts, to the face of an organ, divide the province into two parts ; northern, or *Serra-accina* (mountains above), and southern, or *Beira-mar* (sea-coast). These, again, are subdivided into districts, or comarcas. The greater part of the province of Rio de Janeiro is mountainous. The chief river is the Parahiba, which rises in a small lake in the southern part of the Serra da Bocania ; it flows into the captaincy of San Paulo ; and after a long and tortuous course, re-enters the province of Rio de Janeiro, and runs into the Atlantic. For navigable purposes, the rivers of this province are considered nearly useless.

There are several lakes, the most remarkable are, the Jacaré-pagua, and the Roderigo de Freytas. The *Angra dos Reis* (King's Bay) is very large, and scarcely less splendid than that of Rio de Janeiro ; and, like the latter, is adorned with many islands. The principal of these, Ilha Grande, has good harbours, the best of which has obtained the name of O Seio de Habraham (Abraham's bosom).

At ANGRA DOS REIS there was at an early period a town founded but its subsequent growth did not correspond to the expectation of its founders. Mr. Kidder, in 1842, judged it to contain about 250 houses, which are arranged in a semicircular form upon the praya or low ground, bordered by surrounding mountains.

ILHA GRANDE is about fifteen miles from east and west in length, and at its

greatest breadth about seven miles from north and south. A considerable portion of it is under the cultivation of sugar-cane, coffee, &c. It is frequently resorted to by whale-ships, in order to recruit their stock of wood, water, and fresh provisions.

PARATY is the next port at which the steamboat touches, and the last to the south belonging to the province of Rio de Janeiro. The town is small, but regularly built, and beautifully situated at the extremity of a long arm of the sea, which is adorned with picturesque palm-wooded islands. It contains three churches, dedicated to Nossa Senhora, the first of the conception, second of grief, third of the cliff. The territory connected with this port embraces the fertile plains of Bananal, Paraty-Mirim, and Mambucaba; distinguished for their luxuriant production of many of the fruits of southern Europe, as well as coffee, rice, mandioca, legumes, and the choicest of sugar-cane.

Great labour and outlay has been incurred in completing a macadamised road, from Porta da Estrella, near the head of the Bay of Janeiro, over the serra towards the province of Minas Geraes. Iguassu is a busy place, situated about ten miles from the mouth of a river of the same name, on which it stands. This river rises in the Serra dos Orgaos, and although winding in its course, is navigable for large *lanchas* up to the town. This place, twenty years ago, did not contain more than thirty houses. The planters bring their coffee, beans, farinha de mandioca, toucinho and cotton, to Iguassu, from which it is sent by *lanchas* to Rio de Janeiro.

CITY OF RIO DE JANEIRO.

RIO DE JANEIRO, or San Sebastiao de Rio de Janeiro,* the capital of the empire, stands on the western shores of the Bahia de Rio de Janeiro, one of the most splendidly magnificent inlets of the ocean. This bay, called by the Aborigines *Netherohy*, or hidden waters, is about twenty-four miles in length, nearly north and south, and fifteen miles in its greatest width. The entrance, between two granite mountains, is hardly a mile wide, and formed by two projecting, rocky, and elevated headlands, which are fortified, as well as a small island near the entrance. The Bay of Rio de Janeiro affords one, or rather several of the best harbours on the globe. It is so free from dangers and shoals that no pilot is required. The city, which is at once the sovereign and commercial metropolis of the empire, stands about four miles from the entrance, and extends about three miles over undulating ground.

The aspect of Rio de Janeiro is brightly vivid in its white buildings and verdant back-grounds. It presents no brick walls, dingy roofs, or tall chimneys

* The most recent accounts of Rio de Janeiro and its waters which we have, are those by Captain Wilkes of the United States Exploring Expedition, in the latter end of the year 1838, and that—most valuable of all—by Mr. Kidder.

Captain Wilkes has committed an extraordinary blunder where he says "San Salvador, better known as Rio de Janeiro." San Salvador is the old name of Bahia.

resembling the features of European cities. The houses, churches, and public edifices rise amidst hills which branch off from the adjacent mountains. At the foot, and along the brows of these hills, the white walled and red-tiled roofs, are decked by the luxuriant vegetation of trees and shrubs that impart picturesque beauty to the splendid, and romantic, scenery of a landscape unsurpassed in its variety and in its grandeur.

The Morro do Castello, with its tall signal staff, crests the most commanding height directly above the entrance from ocean to the bay. The Morro telegraph announces the flag, class, and place of each vessel that appears in the offing. Between the Ponta do Calabouço, and the Ilha das Cobras, the older and denser part of the town appears in view.

The emperor has two palaces—the first in front of the general landing-place, which was the ancient residence of the viceroys of Portugal. It is now only occasionally thrown open for reception by the emperor on court days; that is, not as a residence, but much like St. James's Palace in London. The palace of residence is about five miles distant, in the suburb of St. Christopher. There is also the palace of the National Assembly, the palace of the Senate, the palace of the Campo da Honra, the palace of the Municipality, and the palace of the bishop.

Other edifices are the naval and military arsenals, barracks, the Custom House and Consulado, offices of the government and of the police, courts of justice, prisons, and the ancient College of the Jesuits, now the Academy of Medicine, the Academy of the Fine Arts, the National Library, and a National Museum.

The religious buildings are the cathedral, an imperial chapel, about fifty churches and chapels, two monasteries, two nunneries, two public and three private hospitals, and two cemeteries.

The streets intersect each other at right angles except along the beach, and the declivities of the hills, where there is only space for one winding street. The Passeio Publico, or public promenade, commands beautiful views. It is a general resort for recreation. There are several squares or open spaces in other parts of the town. Fountains are numerous, some of them with façades of granite. These supply all the population abundantly with pure running water, flowing along the aqueducts from the mountains.

The chief anchorage of this splendid haven is within hearing of the deep-sounding reverberations of the surges of the ocean. Here are seen floating high in air, the flags of the war and merchant ships of England, of France, of the States, and occasionally those of other European and American states. The war United and the trading fleets have each their respective anchorage grounds.

On arriving by sea in Rio de Janeiro it is usual to land in a small boat at the Largo do Paço, or Palace-square: and at flood tide the waters dash against the granite parapet.

At other landing-places the passenger is carried over the surf on the shoulders of boatmen. There are no docks and wharves, unless it be platforms erected to land from the steam ferry-boats which ply between the city and the opposite side of the bay. Coasting steamers, merchant vessels, and men-of-war all ride at anchor in the harbour.

At the Palace-square, generally, a throng of all colours, especially Africans, are collected round the fountain to obtain water, which flows perpetually from numerous pipes, "and when caught in tubs or barrels, is borne off upon the heads of both males and females."

The slaves are barefooted, even when gaily dressed. To prevent disturbances when the slaves, usually social, happen to fight, soldiers are generally stationed near the fountains.

The Largo do Paço is the resort of the citizens and foreigners, who walk or sit there to enjoy the sea breeze.

The Palace of the Viceroys, now appropriated to various public offices, is a large stone building, in the old Portuguese style of architecture, and contains the suite of rooms in which the court is held on levee days, and has also numerous apartments. The buildings at the rear of the Palace-square were all erected for ecclesiastical or conventual, but now used for secular purposes. The old chapel remains, but has been superseded by the recently-erected imperial chapel, which stands at its right. Adjoining the imperial chapel is that of Our Lady of Mount Carmel, daily open as a cathedral.

The streets are generally narrow, and paved with large stones. The houses seldom exceed three stories in height. In streets chiefly devoted to trade, the first floors only are appropriated as shops, and families occupy the upper apartments.

The buildings are nearly all built of granite. The outside walls consist of small and irregular stones cemented and coated with plaster. The colour is almost invariably a clear white, on which the sun often reflects a painful brilliancy to the eyesight.

The Rua Direita is the widest and most business-like street: it runs nearly parallel to the shore of the bay.*

* Nothing can be more animated and peculiar than the scenes which are witnessed here during the business hours of the day, namely, from nine A.M. till two P.M. During these hours only vessels are permitted to discharge and receive their cargoes, and at the same time all goods and baggage must be dispatched at the Custom-house, and removed therefrom. Consequent upon such arrangements, the utmost activity is required to remove the goods dispatched at the Custom-house, and to embark those productions of the country that are daily required in the transactions of a vast commercial emporium. When the reader, moreover, is told that all this labour is performed by human hands,—that scarcely a cart or a dray is used in the city for such purposes, unless, indeed, it is drawn by negroes, as for the heavier burdens a few are,—he will be prepared to figure before his mind some scores of negroes moving with loads upon their heads in every direction.

The coffee carriers usually go in troops, numbering ten or twenty individuals, of whom one takes the lead, and is called the captain. These are usually the largest and strongest men that can be found. While at work they seldom wear any other garment than a pair of short pantaloons;

The *Praca do Commercio*, or Exchange, in the *Rua Direita*, was formerly a part of the Custom-house, but given by government for a Bourse or Exchange, in 1834. At considerable expense it has been much improved in appearance. Its reading-room is supplied with Brazilian and foreign newspapers. Beneath its portico the merchants of different nations meet in the morning to negotiate their respective affairs.

Adjoining the *Praca* is the *Alfandega*, or Custom-house. The extensive warehouses of this establishment extend to the sea-side, and goods are landed under cover from boats or lighters, and then warehoused until a requisition is formally made for their examination and delivery.

The commercial houses have usually a custom-house clerk, whose business it is to pass goods at the *Alfandega*, and which relieves strangers from any trouble.

In getting through the *portão grande* of the customs, about the time that its toll-gate is being closed up for the day, boxes, bales, and packages of every species of goods, cases of furniture, pipes of wine, and coils of rope, present confused heaps, among which are crowds of clerks, *feitores*, and negroes, who rush and vociferate to seize on their packages.

In the same street is the *Correio Geral*, or General Post-Office. The larger mails are forwarded and received by the coast, and generally by sailing vessels. The inland mails depart once in five days. They are despatched and received by means of men on horseback or by foot carriers. Charges for postage are moderate.

Owing to the warmth of the climate, there is no necessity for closed doors in Brazil, but ventilation is necessary. Each door is hung with a green cloth, bearing the imperial coat of arms, and resembling the national flag, which is a sphere of gold on a cross of the Order of Christ, surrounded by a circle of stars in silver, representing the different provinces of the empire; the escutcheon is surmounted by the imperial crown, and supported by a wreath of coffee tree and the tobacco plant. The Brazilians enthusiastically admire their flag; and it is daily exhibited, suspended over doors, or over their forts and shipping.

their shirt is thrown aside for the time as an incumbrance. Each one takes a bag of coffee upon his head, weighing one hundred and sixty pounds, and when all are ready they start off upon a measured trot, which soon increases to a rapid run.

As one hand is sufficient to steady the load, several of them frequently carry musical instruments in the other, resembling children's rattle-boxes, these they shake to the double quick time of some wild Ethiopian ditty, which they all join in singing as they run. Music has a powerful effect in exhilarating the spirits of the negro, and certainly no one should deny him the privilege of softening his hard lot by producing the harmony of sounds, which are sweet to him, however uncouth to other ears. It is said, however, that an attempt was at one time made to secure greater quietness in the streets, by forbidding the negroes to sing. As a consequence they performed little or no work, so the restriction was in a short time taken off. Certain it is, that they now avail themselves of their vocal privileges at pleasure, whether in singing and shouting to each other as they run, or in proclaiming to the people the various articles they carry about for sale. The impression made upon the stranger by the mingled sound of their hundred voices falling upon his ear at once, is not soon forgotten.

The streets of Rio have descriptive names : for example, those which lead out of the Rua Direita at right angles with it, are Rua dos Pescadores, Rua do Sabão, Rua da Alfandega, Rua do Rozario, Rua do Ouvidor. Parallel with the Rua Direita are the Rua da Quitanda, the great mart for dry goods, and the Rua dos Ourives, in which most of the jewellers and artisans in gold and silver are located. The Rua do Ouvidor is chiefly occupied by French, whose shops are filled with rich and fancy goods.

On the corners of several of the streets are niches with images of some grim saint or Madonnas. Candles are lighted, novenas are sung, and prayers are offered in front of these images, though many are in a state of decay.

"There are," says Mr. Kidder, "within the city and its suburbs about fifty churches and chapels. They are generally among the most costly and imposing edifices of the country, although many of them have but little to boast as respects either plan or finish. They may be found of various form and style. Some are octagonal, some are in the form of the Roman and some of the Grecian cross, while others are merely oblong. The church of the Candellaria is one of the largest, with spires and a handsome front. Like nearly every other building for ecclesiastical purposes in the country, it stands as a memento of past generations.

"The chapels of the convents are in several instances larger, and probably more expensive, than any of the churches. That of the convent of St. Benedict is one of the most ancient, having been repaired, according to an inscription it bears, in 1671. The order of the Benedictines is by far the richest in the empire, possessing houses and lands of vast extent, though the number of monks is at present quite small."

In Rio de Janeiro all the most elevated and commanding sites of its vicinity are occupied by churches and convents.

Of the hospitals of Rio de Janeiro, there are several belonging to different Irmandades, or Brotherhoods. "These Brotherhoods are not dissimilar to the beneficial societies of England and America, though on a more extended scale. They are generally composed of laymen, and are denominated third Orders, as, for example, Ordem terceira do Carmo, da Boa Morte, do Bom Jesus do Calvario. The Brotherhoods contribute to the erection and support of churches, provide for the sick, bury the dead, and support masses for souls. In short, next after the state, they are the most efficient auxiliaries for the support of the religious establishment of the country. Many of them, in the lapse of years, have become rich by the receipt of donations and legacies, and membership in such is highly prized.

"The Foundling Hospital is sometimes called *Casa da Roda*, in allusion to the wheel in which infants are deposited from the streets, and by a semi-revolution conveyed within the walls of the building.

"That such institutions are the offspring of a mistaken philanthropy, is as evident in Brazil as it can be in any country. Not only do they encourage licentiousness, but they foster the most palpable inhumanity. Out of 3630 infants exposed in Rio during ten years anterior to 1840, only 1024 were living at the end of that period. In the year 1838—1839, 449 were deposited in the wheel, of whom six were found dead when taken out; many expired the first day after their arrival, and 239 died in a short period.

"The Asylum for Female Orphans, *Recolhimento*, is a very popular establishment. It is chiefly supplied from the Foundling Hospital.

"The annual expenses of the *Misericordia* are from 80,000 to 100,000 dollars. A small portion of its receipts are provided for by certain tributes at the custom-house, another portion by lotteries, and the balance by donations and the rent of properties which belong to the institution through purchase and legacies. The Foundling Hospital and *Recolhimento* have been in existence about 100 years. The original establishment of the *Misericordia* dates back as far as 1582. It took place under the auspices of that distinguished Jesuit, Jozé de Anchieta."

There is, at Rio de Janeiro, a scarcity of inns and boarding-houses. "There are several French and Italian hotels, with restaurants and rooms to rent; and these are chiefly supported by the numerous foreigners constantly arriving and temporarily residing in the place. But among the native population, and intended for Brazilian patronage, there are only eight or ten inns in a city of 200,000 inhabitants, and scarcely any of these exceed the dimensions of a private house. It is almost inconceivable how the numerous visitors to this great emporium, from every part of the empire, find necessary accommodations. It may safely be presumed that they could not, without a heavy draft upon the hospitalities of the inhabitants, with whom, in many instances, a letter of introduction secures a home. In the lack of such a resort, the sojourner rents a room, and by the aid of his servant and a few articles of furniture, soon manages to live, with more or less frequent resorts to some *casa de pasto*, or victualling-house. Most of the members of the National Assembly are understood to keep up domestic establishments during their sojourn in the capital. As a consequence of this lack of inns and boarding-houses, nearly all the commercial firms are obliged to maintain a table for the convenience of their clerks and guests. On the whole, this arrangement is probably better for the morals and habits of the young men they employ, who thus live under the immediate supervision of their superiors, than if they were to be scattered abroad promiscuously, as those in a similar condition often are in our own cities. Many of the foreign residents, particularly the English and Americans, locate their families in some of the extensive suburbs of the city, and go to and fro morning and evening. The municipal regulations of the city are in some respects peculiar."—*Kidder's Brazil*.

There is a public slaughter-house (*matadouro*), where all the cattle consumed in the town are slaughtered, but there are no public markets. Butchers open private stalls, especially in the *Rua de San Jozé*. Vegetables, fruits, and poultry are abundantly offered for sale in most of the public places. At these places, also, various dishes are cooked and eaten on the spot by the slaves and lower classes.*

The waters of Brazil abound in numerous varieties of fish, with which the market is well supplied. Horticulture is in a rude state, but the indigenous fruits of the country are delicious and abundant, among which are oranges, limes, cocoa-nuts, pine-apples, mangoes, bananas, pomegranates, mammoons, goyabas, jambos, *araças*, mangabas, and many other species of delicious fruit. These are brought in profusion to the markets, and hawked about in baskets on their heads by slaves and free negroes. Most sorts of goods are sold in the same way. Pedlars are constantly chanting the excellence of their commodities.

Mr. Walsh remarked, in 1828, that beggars were seldom seen in the streets of Rio. Mr. Kidder says this was far from being the case in 1838. Through the lenity or carelessness of the police, great numbers of vagrants were continually perambulating the streets and importuning for alms; and mendicants of every description had their chosen places in the thoroughfares of the town, where they regularly waited, and saluted the passers-by with a mournful drawl.

The House of Correction is situated on the brow of a high hill. Its grounds are surrounded by high granite walls, constructed by the prisoners. Near it is a quarry, where numbers of prisoners are employed. All are made to labour in some kind of work. The more refractory are chained together. Slaves are also sent here to be corrected. Mr. Kidder says,—“they are received at any hour of the day or night, and retained free of expense as long as their masters choose to leave them. It would be remarkable if scenes of extreme cruelty did not sometimes occur here.”

There are other prisons in this city. By the latest report at hand, there were in the two other principal prisons “366 prisoners, committed on the following charges:—Sixty-two homicide, four threats, fifty robbery, nine swindling, three perjury, seventy-nine theft, twenty-seven assault and battery, eleven attempts to

* “As in all other countries,” says Mr. Kidder, “the style of living in Brazil varies very much with the condition of families, from the most extravagant etiquette of the wealthy, to the plain substantial diet of the common people. But, I venture to affirm, that whosoever has dined with a respectable Brazilian family, at least within the precincts of any of the cities of the empire, has seen genteel provisions for the table. I have no disposition to edify the reader of these pages with detailed descriptions of every dinner or pic-nic in which I had a share, or of dilating upon the marvellous adventures of such occasions. But from my own observation I became convinced that the Brazilians have learned to appreciate sufficiently the various luxuries with which foreign commerce supplies their markets, while they also understand the use of those indigenous productions and peculiar dishes of the country, which foreigners are slow to appreciate, but which possess a real excellence.”

rob, six use of arms, three calumny, two prohibited games, twenty-three counterfeiting, thirty-nine committed abroad, crimes unknown, three enslaving free persons, two aiding prisoners to escape, six resistance to authority, three suspicion of being fugitive slaves, two rape, two defrauding revenue, twenty-one sentenced for correction. Only 159 of these persons had been tried and sentenced. Five were to suffer capital punishment. Eleven of those sentenced for correction had been transferred from the Calabouço. This is a dungeon on the point of land stretching into the bay, just in front of the city, where fugitive slaves are confined until called for by their masters."

There are also places of confinement in the different forts.

"The streets of few cities," says Mr. Kidder, "are better lighted than those of Rio. Throughout the bounds of the municipality large lamps are arranged at given distances from each other, not upon posts permanently, but with certain iron fixtures, by which they are lowered for cleaning and lighting. Oil is universally used, gases not having as yet been introduced. A much smaller number of police officers is required to be on duty, and many crimes are prevented by the dissipation of that darkness under which they would seek a covert.

"Whatever may have been the facts in former years, great quietness prevails throughout the city at night. The head-quarters of the police are in an ancient public building, in the Rua da Guada Velha. That department of the municipal government is understood to have been administered with unwonted discretion and efficiency during a few years past.

"All foreigners, before landing, are required to deliver their passports to the visiting officer of the port. These passports are handed over by that officer to the secretary of the police, on whom the foreigner must call, within a given time, to verify the description of his passport, and to receive a licence to reside in the country. The visit is usually one of ceremony.

"All children born in the city, whether rich or poor, bond or free, black, white, or yellow, to be vaccinated as a preventive of the small-pox. To provide for this, a Vaccine Institute (Junta Vaccinica) has been established, which is open all Thursdays and Sundays. A number of professors are always in attendance here, and vaccination is performed on all who come or are brought to receive it, free of charge. The patient is required to return on the eighth day to have the pustule examined. From some of the best specimens of its operation the virus is taken and inserted in other arms, and thus perpetually preserved.

"The lower floor of the City Hall (Camara Municipal) is devoted to the use of the Vaccine Institute. This edifice is located on the east side of the Campo da Honra.* A mingled throng is generally present on the mornins when vaccination is performed at the institute. Here will be seen a company of *negros*

* Campo da Honra and Campo da Acclamação, are the modern names of the Campoda Santa Anna.

novos, or newly-imported Africans; there an Indian and a *tropeiro* from the interior; while on all sides of the house, and on benches placed at intervals through the sala, are nurses, and mothers, and children in abundance."

In front of the Camara Municipal several elegant views may be enjoyed. On the left, looking toward the north-east, may be seen a large and much frequented fountain, the military arsenal, and the hill on which the bishop's palace is located.

"The National Museum is open to public visitation every Thursday. The collection of curiosities is interesting, but not extensive. That of minerals has been much augmented by the cabinet of Jozé Bonifacio de Andrada, who early in life had been professor of mineralogy in the University of Coimbra, in Portugal, where he published several works that gained him a reputation in Europe. The department of mineralogy is well arranged, but contains more foreign than native specimens. Brazilian curiosities are not numerous in other departments: among the aboriginal relics are a fair collection of ornaments and feather dresses from Pará and Matto Grosso.

The imperial academy of the Fine Arts was founded in 1824, by a decree of the National Assembly. It has a director, four professors, viz., of painting and landscape, of architecture, of sculpture, and of design, with a number of assistants. It is open to all who wish to be instructed. About seventy students are matriculated annually. In 1843 the whole number of students was 100.

The Imperial Academy of Medicine is the old Jesuits' college, near the Morro do Castello, and is attended by from 100 to 150 students. Several of the professors have been educated in Europe. It is in close connexion with the Hospital da Misericordia.

There are also military and naval academies. At fifteen years of age, any Brazilian lad who understands the elementary branches of a common education, and the French language, so as to render it with facility into the national idiom or Portuguese, may, on personal application, be admitted to either of these institutions. The latter is located on board a man-of-war, at anchor in the harbour.

The Collegio de Dom Pedro II., established in 1837, corresponds to the lyceums established in most of the provinces.

The number of collegios and aulas, for elementary instruction, in Rio is numerous. The public schools, of which there are twenty-eight, with about 1000 pupils, are still insufficient, and private individuals, Portuguese, French, English, and Italian, have been induced to open schools.

The episcopal seminary of San Joseph, under the direction of the diocesan bishop, for educating young men for the priesthood, was founded as early as 1740. It has a rector, vice-rector, professors of doctrines and morals, of philosophy, of Latin, of chanting, of French, and English.

The national library consists chiefly of the books originally belonging to the royal library of Portugal, brought over by Dom John VI., who opened it to the public.

The English, the German, and the Portuguese residents have each established libraries for their respective use.

With the exception of pamphlets and small volumes, scarcely any original works have been published. Mr. Kidder informs us the revolutions and political agitations of Portugal have had a tendency to drive the literati of that kingdom to more quiet scenes. Many of these have taken up their abode in Paris, and it has become their interest to write and publish for Brazil as well as for Portugal. Moreover, these are the degenerate days of Portuguese literature, in which the pure Lusitanian is corrupted by Gallicisms, and the press is burdened with translations from other tongues, almost to the exclusion of original works. Every petty novel from the *feuilletons* of Paris, must be translated to make a book in Lisbon and in Rio de Janeiro. So much are the multitude occupied with reading these useless productions, that they have but little time or inclination to inquire for what is original and substantial. Besides, the French language has usurped the place of Latin in Brazil. A knowledge of it is required as a prerequisite to an entrance into all public institutions of the higher grade, and it is very generally read. Hence, French books are in demand, and to a great extent usurp the place of those in the mother tongue. Almost every vessel from Havre also, brings out a large invoice of French books to be sold at auction.

Book auctions, indeed, are of very frequent occurrence. Europeans who are about to retire to their native country, and Brazilians who go abroad, generally dispose of their libraries by public sale.

The newspaper press in Rio issues four daily, two tri-weekly, and from six to ten weekly papers and irregular sheets. "During the session of the national assembly, the proceedings and debates of that body are published at length on the morning after their occurrence. The established papers are not, as in this country, the organs of different political parties. While they enter warmly into political discussions, they seem to consider it a duty to be always on the side of the government, or the party in power. Hence, however much any change is deprecated before it occurs, yet when it is once consummated, it is chronicled as a glorious event. If the party in the minority wish to abuse those in power, they must establish a journal for the express purpose, or publish their correspondence in handbills, which are sent out as an accompaniment to the daily news, into whose columns it could not be admitted.

"Let the minority, however, once rise into power, and these columns are all at its service; being still zealously devoted to the support of the government. Much

pains is taken by some of the papers to give commercial intelligence fully and correctly, while none of the sheets are filled with stereotyped advertisements.

"The matter of the advertising columns is renewed almost daily, and is perused by great numbers of general readers, for the sake of its piquancy and its variety."

"Not a few of these annuncios appear singular. It was announced at one time, that a solemn *Te Deum* would be celebrated on a given day, in the church of San Francisco de Paula, for the happy restoration of Bahia, subsequent to a rebellion in that city, and that his imperial majesty would attend. A few days after, the following appeared:—"The committee to make arrangements for the *Te Deum* in San Francisco de Paula, thinking that they would better satisfy the philanthropic designs of those who have subscribed for that object, by remitting the money in their hands to Bahia, to be divided among the poor widows and orphans, and especially, since *due thanks* have already, in another church, been offered to God for the restoration; have resolved not to have the proposed *Te Deum* sung, of which persons invited are now informed."

The daily papers of Rio resemble those of Paris very much in form, style of printing, and arrangement. The bottom of each sheet contains the *Folhetim*. The *Folhetim do Jornal do Commercio*, during an entire year contained only one original tale, the remainder of its contents being translated from the French.

There is a Medical Review, and a Brazilian and Foreign Quarterly. The last periodical has been conducted with great spirit and literary enterprize, and promises to be of utility to the country: but it is often filled with translations.

The Brazilian Historical and Geographical Institute, was founded at Rio de Janeiro, in 1838, and has produced beneficial effects. This association adopted as its fundamental object the collecting, arranging, and publishing or preserving documents illustrative of the history and geography of Brazil. The General Assembly voted a yearly subsidy of 2000 milreis in aid of its objects, and the department for foreign affairs instructed the *attachés* of the Brazilian embassies in Europe, to procure and to copy papers of interest, that exist in the archives of different courts, relative to the early history of Brazil. During the first year of its existence, it numbered about 400 members and correspondents, and had collected above 300 manuscripts. It publishes at length, in a Quarterly Review and Journal, the proceedings of the society.

ENVIRONS OF RIO DE JANEIRO.

The immediate neighbourhood and environs of Rio de Janeiro are beautifully interesting. The Praya do Flamingo, is a sandy beach, deriving its name from the flamingos by which it was formerly frequented. A handsome row of residences extends along its shore. "Their occupants," says Mr. Kidder, "are daily refreshed with strong sea-breezes, and entertained by night and by day with the heavy and measured music of the ocean's roar." Parallel with this praya runs the Catête, a wide

and important street, leading from the city to Botafogo. About half-way between the town and the last-mentioned suburb, is the Larangeiras, or the valley of orange groves. A shallow but limpid stream gurgles along a wide and deep ravine lying between two precipitous spurs of the Corcovado mountain. Passing up its banks you see scores of *lavadeiras*, or washerwomen, standing in the stream and beating their clothes upon the boulders of rock which lie scattered along the bottom. Many of these washerwomen go from the city early in the morning, carrying their huge bundles of soiled linen on their heads, and at evening return with them, purified in the stream and bleached in the sun. Fires are smoking in various places, where they cook their meals; and groups of infant children are seen playing around, some of whom have been large enough to tottle after their mothers; but most of them have been carried there on the backs of the heavily burdened slaves. Female slaves, of every occupation, may be seen carrying about their children.

"Up the valley of the Larangeiras is a mineral spring, *Agua Ferrea*, indicating the chalybeate properties of the water, which at certain seasons of the year is much frequented. Near this place the road leads up the Corcovado, which may be ascended on horseback within a short distance of the summit. The ascent should be commenced early in the morning, while the air is cool and balmy, and while the dew yet sparkles on the foliage. The inclination is not very steep, although the path is narrow and uneven, having been worn by descending rains. The greater part of the mountain is covered with a dense forest, which varies in character with the altitude, but everywhere abounds in the most rare and luxurious plants. Towards the summit large trees become rare, while bamboos and ferns are more numerous. Flowering shrubs and parasites extend the whole way. At no great distance from the top is a rancho, where one may breakfast.

"The horses are here left behind, and in a few minutes' walk the thicket ceases. Above this the rocks were covered with only a thin soil, and but here and there a shrub nestling in the crevices. What appears like a point from below, is, in reality, a bare rock, of sufficient dimensions to admit of fifty persons standing on it to enjoy the view at once, although on every side, save that from which it is reached, its sides are extremely precipitous. In order to protect persons against accidents, iron posts had been inserted, and railings of the same material extended around the edge of the rock. Save this slight indication of art, all around exhibited the wildness and sublimity of nature.

"The elevation of the mountain, 2000 feet, is just sufficient to give a clear bird's-eye view of one of the richest and most extensive prospects the human eye ever beheld. The harbour, and its islands; the forts, and the shipping of the bay; the whole city, from San Christovão to Botafogo; the botanical garden; the Lagoa das Freitas, the Tejuco, the Gavia, and the Sugar-Loaf mountains; the islands outside the harbour; the wide-rolling ocean on the one hand, and the

measureless circle of mountains and shores on the other; all lie expanded around and beneath.

"From the sides of this mountain various small streamlets flow downward. By means of artificial channels, these are thrown together to supply the aqueduct of the city. In descending, this remarkable water-course is followed, until the city is entered, at the grand archway leading from the hill of Santa Theresa to that of San Antonio. Nor is this section of the route less interesting to those fond of nature. All along negroes are met, waving their nets in chase of the gorgeous butterflies and other insects, which might be seen fluttering across the path and nestling in the surrounding flowers and foliage.

"Many slaves are trained from early life to collect and preserve specimens in entomology and botany, and, by following this as a constant business, gather immense collections."

The aqueduct which supplies Rio de Janeiro with pure fresh water is a "vaulted channel of mason work, passing sometimes above and sometimes beneath the surface of the ground, with a gentle declivity, and air-holes at given distances."

Between the city of Rio de Janeiro and the entrance from the ocean lies the nearly circular indentation of Botafogo, which, with its surrounding mountains, including the lofty Corcovado on the right, the Sugar-Loaf on the left, the distant *Gavia*, or topsail mountain, and the *Tres Irmaões*, or Three Brothers, forms a most picturesque view. Praya Vermelha, below the Sugar-Loaf, extends from the fortress of San Joaõ to Fort Praya Vermelha. The latter is a station for recruits to the army. Here the unfortunate aborigines taken from the upper Amazon and other parts are drilled. This fortress was the scene of a sanguinary outbreak of the German soldiers and the Brazilians.

On the beach of the Atlantic, called Copa Cabana, beyond the Sugar-Loaf, are a few fishermen's huts and a few old houses. The sand of this beach is as white as the surf which rolls over it.

The Botanical Garden is situated west of Botafogo, in a spot not well chosen, though much resorted to. It is the property of the government, and the National Assembly grants annually a sum for its support and improvement. Mr. Kidder, who does not speak favourably of its condition, says,—"Much pains were taken at an early day to introduce choice trees and plants from India; and cloves, cinnamon, pepper, and tea, are among its present productions. Recently, the tall nogueiras da India, or Sumatra nut-trees, which were planted for the sole benefit of their shade, have to some extent, given place to mulberry and fruit trees, capable of at once shading the walks, and of adding to the valuable products of the soil."

Engenho Velho, the principal suburb of Rio Janeiro, lies on the west, and the street or road leading to it is through the Campo da Acclamação, and the

Cidade Nova, by the Rua de San Pedro, the Aterrado, or highway to San Christovão, and the imperial palace of Boa Vista.

At the foot of the Tejuco Mountains, there is a fertile and somewhat extensive plain, within the limits of the city, but occupied by detached houses and wide streets nearly all bordered with hedges of flowering mimosas. The houses are not remote from each other, nearly every house in this suburb is surrounded by a garden, and embowered in the foliage and shade of fruit and other trees. Mr. Kidder, who resided in this suburb, says,—“For the very perfection of rural beauty, few spots on the earth can equal Engenho Velho. Our residence was in the Rua de San Francisco Xavier, within sight of the parish church, and probably at no great distance from the spot on which the Jesuits had anciently established the Sugar Engenho that gave name to the vicinity. The house in which we lived was contiguous to a large chacara, as the land attached to a country seat is usually denominated. In front of the palace of Boa Vista may be enjoyed a magnificent view, looking towards the city. The eye first rests upon the rich foliage of the trees bordering the imperial grounds at the foot of the hill; next upon several groups of houses near the public road, among which stands that monument of the first emperor's shame, the palace he built as a residence for his publicly acknowledged mistress, the Marchioness of Santos. A little to the left, on a green eminence, is the Hospital dos Lazaros; and then, the beautiful sheet of water formed by a recess of the bay, which stretches itself around a high ridge of granite hills, and at high tide seeks to return upon the rear of the city itself.”

Boats are always plying over different parts of the bay of Rio Janeiro with passengers and produce. “By taking a seat in one of them, at the nearest place of embarkation, you may in a few moments be set down at the Sacco d'Alferes, from which a moderate walk will take you into the city, either by a rough winding path over the hill, to the Campo da Honra, or along the sea-side, by the Praya de Gamboa, where the English cemetery is located, and through the Vallongo, where the slave mart used formerly to be held. If, however, it is preferred to pass the whole distance by water, the course will be sufficiently near the shore to show all the beauties of its vegetation, and of the buildings which line its successive prayas. These buildings are most of them low, and insignificant with respect to architecture, but their whitened walls always present a beautiful contrast to the greenness of the vegetation around them.

“Rounding the Ponta da Saude, you come to the general anchorage of all the merchant vessels that may be receiving or awaiting cargo. Here, may be seen the long, low, clipper-built brigs and schooners that ply between the coasts of Brazil and Africa. There, is the heavy, dull-sailing bark of the Norwegian, or the Hamburghese. On either hand, over vessels of every class, from the coasting smack to the largest freighting ships, may be seen the flags of Spain, Portugal,

Sardinia, Tuscany, Naples, France, Belgium, Bremen, Austria, Denmark, Sweden, England, the United States, the South American Republics, and Brazil. These vessels are required to anchor at sufficient distance apart to swing clear of each other in all the different positions in which the ebbing and flowing tide may place them; thus boats may pass among them at pleasure. Here and there guard-ships are stationed, to prevent smuggling; and near by are several hulks of Brazilian men-of-war, one of which is used as the seat of the Naval Academy.

"Having passed through the entire extent of this anchorage, your boat is opposite the Convent of San Bento, and veering to the right, you pass into the channel between the Ilha das Cobras and the mainland. Beneath the hill on which the monastery is located is the Naval Arsenal, with a small yard tastefully arranged; and just beyond it are the red stairs (*escadas vermelhas*), a well-known landing-place, contiguous to the Praya dos Mineiros, and the Rua Direita."

The communication between different parts of the city has within late years been greatly facilitated by an omnibus company, which established regular lines of carriages between the Praça da Constituição, a central point in the city, and Laranjeiras and Botafogo on the one side, and San Christovão and Engenho Velho on the other. These carriages are each drawn by four mules.

From Engenho Velho an excursion is easily made to Tejuco, a beautiful place amphitheatrically surrounded by mountain peaks and with several coffee plantations. The pure air of these mountains renders Tejuco a place much resorted to, especially in the hot months of December, January, and February.

The grounds attached to the Palace of Boa Vista, are extensive, and intersected by long walks, shaded by splendid mangueiras and other trees, along the borders of natural, and artificial streams of water. Here may be seen stone troughs, at which strong washerwomen are beating clothes; and there is a fishing pond with a boiling fountain in the centre, and a boat alongside, in which his majesty used to amuse himself.

The palace is situated on an eminence at the right of the gardens. It was originally a private residence, presented by its generous owner to Dom John VI. It has been gradually enlarged and improved, and thus rendered very suitable to the purposes to which it is devoted. Eleven leagues beyond San Christovão, in a westerly direction, is the imperial fazenda of Santa Cruz. This plantation is occasionally visited by the imperial family as a place of recreation. It is an immense estate, upon which vast numbers of slaves are employed. It was, at an early day, the site of a Jesuit college, and for many years past had been the property of the government; but still is only partially redeemed from a state of nature. That portion of it which has been reduced to cultivation, is said to be in an indifferent state, notwithstanding much expense has been lavished upon it. This circumstance is sufficient to indicate the generally low state of agriculture

in the empire; in further proof of which, it would only be necessary to state that the plough is almost wholly unknown.

Of the numerous islands in the Bay of Rio de Janeiro, Ilha do Governador, or Governor's Island, is the largest, being in length twelve miles from east to west. Nearly all the islands are inhabited, and under tolerable cultivation.

The most important places upon the borders of the bay are Magé, Piedade, Porta da Estrella, and Iguassú. To these several places great quantities of produce are carried down on the backs of animals from the interior, and then conveyed in small vessels to the city.

CHAPTER XIV.

COMMERCE OF RIO DE JANEIRO.

THE port of Rio de Janeiro, with its capacious and safe harbours is admirably situated for commerce. It is much resorted to by vessels in distress, navigating the ocean between the equator and the Capes of Good Hope and Horn. Ships of war and merchant vessels bound round Cape Horn or the Cape of Good Hope, find this a most convenient place to procure water and fresh provisions. Ships from Europe and North America meet in this great conveying harbour ships sailing to or arriving from Bombay, Canton, New Holland, New South Wales, Valparaiso, and the various islands of the Pacific, as well as California and Oregon, on the western coast of North America.

Rio de Janeiro has become the chief emporium of Brazilian commerce, and especially of its mining districts. All the ports on the coast south of Bahia, and it may be said to the frontiers of the Banda-Oriental—to Monte Video, send most of their produce for exportation to Europe or for home consumption to Rio de Janeiro. Farinha, beans, bacon, and dried or salt meat are brought to the metropolis. Hides, horns, dried meat, tallow, and bacon, with rice and wheat flour, come by sea, chiefly from the provinces of Rio Grande do Sul, and San Paulo. The latter furnishes also cheese, the bark of the mangrove-tree for tanning, with some gum-woods, sugar, and rum. Santa Catherina sends also sole leather, onions, garlic, dried fish, and pottery. The small harbours to the north of Rio de Janeiro, viz., San João do Paraiba, San Salvador, Macahe, Porto Seguro, Caravelhas, Victoria, &c., supply vegetables and fish, beams, planks, hoops, Brazil-wood, bark, charcoal, fuel, cocoa-nuts, tobacco, sugar, rum, rice, &c. Cape Frio sends lime, tubs and casks made of the trunk of the gamelleira (fig-tree). Ilha Grande furnishes pottery and lime. Bahia sends *slaves*, tobacco, millstones, *tucum* (thread made of the fibres of the palm), and cocoa-nuts; Pernambuco, salt, saltpetre, &c. Monte Video, hides, horns,

leather, &c. This coasting trade is principally carried on in small one or two-masted ships, and keeps up a constant intercourse between the whole Brazilian coast and the capital. From the mouth of the Plata to Rio de Janeiro, the voyage generally occupies from twenty-two to thirty days; from Santa Catharina and Rio Grande do Sul, in from fifteen to six-and-twenty days: from Porto Seguro in from eight to fifteen; from Bahia in from twelve to twenty; much depending, however, on the season and the winds.

The inland trade is extensive between Rio de Janeiro and the neighbouring provinces, with San Paulo and Minas, to which there are passable roads for animals over the mountains. The latter sends its cotton, coffee, and tobacco chiefly to Rio, though further from some parts than Bahia, the road being less difficult: it exports also, besides its precious stones, cheese, marmalade, brown sugar, and very coarse cottons for clothing the slaves and poor shepherds of the southern provinces. From Rio Grande do Sul and San Paulo, many thousands of oxen, horses, and mules are annually driven to Rio Janeiro. The inhabitants of the remote provinces of Matto Grosso and Goyaz bring gold in bars and dust, precious stones, and smuggled diamonds (the latter being contraband), to exchange for European manufactures. To the smaller ports of Brazil Rio exports all sorts of European goods, to both the western and eastern coasts of Africa English and Portuguese goods; to Europe sugar, coffee, cotton, tobacco, hides, otters' skins, horse-hair, &c.; and in speaking of trade, we must not omit the abhorred traffic in human beings, which disgraces Rio de Janeiro.

COMMERCIAL REGULATIONS OF RIO DE JANEIRO, AND OF OTHER BRAZILIAN PORTS.

Regulation relative to Brazil-wood.—The exportation of Brazil-wood from the ports of Brazil, has always been an exclusive privilege of the imperial government; but, as abuses have occurred, and some vessels, perhaps through ignorance of the Brazilian laws in relation to the trade, have exported on private account the said article to foreign ports, it is made known, to those whom it may concern, that the laws of Brazil forbid entirely the exportation of the article by private individuals, and impose a fine of thirty milreis (fifteen dollars) a ton on each vessel that may take the wood by contraband, from any part of the empire, to foreign countries. The fine will be enforced even after the departure of the vessel from Brazil, for which purpose the government has taken all necessary measures to arrest the aiders and abettors in the clandestine shipment.

Tonnage Duties of Brazil.—Art. 1. After the 11th November, 1844, the anchorage dues upon Brazilian and foreign ships in foreign trade will be reduced to 900 reis, and the dues upon the Brazilian coastwise vessels to ninety reis a ton, for what period soever they may remain in port.

Art. 2. Ships arriving in ballast, and sailing with cargo, and arriving with cargo, and sailing in ballast, will pay one-half the dues—entering and clearing in ballast, one-third dues.

Art. 3. Ships entering for provisions, or in Franguia to try the market, whether in ballast or with cargo, will pay one-third.

Art. 4. Ships entering under average, or in distress, will pay nothing, unless they discharge or take cargo; being allowed to discharge the necessary cargo for the payment of the expenses incurred.

Art. 5. Ships that have paid in any port of the empire the anchorage dues of the articles 1st, 2nd, and 3rd, arriving in another port in the same voyage, pay nothing excepting taking cargo, and then have to pay the difference of the dues.

Art. 6. Coastwise vessels, trading between the ports of the empire, will pay one-half the dues when half the crew be composed of Brazilian citizens; and will pay nothing if, besides this circumstance, they be employed in the coast or in the high sea fishery.

Art. 7. Vessels of countries that will charge more dues upon Brazilian tonnage, or port dues higher than dues paid by their own vessels, are subject, in the ports of Brazil, to pay one-third more of the dues established, or to be raised to the same difference imposed by the said countries upon the Brazilian vessels.

LUIS HENRIQUE FERREIRA D'AGUIAR, Consul-General.

To guide Owners and Captains of Vessels bound to the Brazilian Ports.

To despatch a vessel at the office of the consulate of Brazil are necessary:

Three copies of the manifest, one certified at the custom-house.

The invoice of *all* and *every* shipper.

Bills of lading.

Bill of health.

List of crew; and passengers, if any, must take passports.

It is also necessary to give three days' notice at the consulate, of the intended departure of vessels, for any port in Brazil.

Art. 146. The master of any vessel sailing with a cargo for any of the Brazilian ports ought to bring two copies of his manifest, exactly alike, which must contain:

Sec. 1. The name, description, and tonnage of the vessel.

Sec. 2. The master's name, with the date at the end, and his signature.

Sec. 3. The port where he took the cargo, stated in the manifest.

Sec. 4. The port or ports said cargo is bound to.

Sec. 5. The marks, countermarks, number of packages, and their descriptions, such as bales, boxes, chests, pipes, half pipes, barrels, tierces, &c.

Sec. 6. A declaration of the quantity and quality of the merchandise in each package as near as possible, or of several homogeneous packages with the same mark, and of the goods stowed loose.

Sec. 7. The names of the shippers and consignees, or whether they are to order. Every thing must be written in words at length, except the numbers of the packages, and on entire sheets of paper not pieced to one another.

Art. 147. When a vessel has taken cargo at more than one port, she ought to bring a manifest from each one of the ports whereat she may have received shipment.

Art. 148. At the end of the manifests, the master shall state the number of passengers, both cabin and steerage ones, and make all other declarations he may deem necessary.

CUSTOMS' TARIFF OF BRAZIL.

Imperial Decree of the 12th of August, 1844:

Ordering the carrying into effect of the regulation and tariff of the custom houses of the empire.

I am pleased in virtue of the authority conferred on the government, by the 10th article of the law of 243 of the 30th of November, 1841, that from the 11th day of November of the present year forward, the regulations and tariff issued herewith, signed by Manoel Alves Branco of my council of state, minister and Secretary of State for the Finance Department, and President of the Public National Treasury, shall be observed, and the said minister shall so understand it, and cause it to be executed. Palace of Rio de Janeiro, 12th of August 1844, twenty-third year of the independence, and of the empire. With the sign manual H. M., the emperor.

(Signed)

MANOEL ALVES BRANCO.

Regulation for carrying into effect the tariff of the custom houses of the empire of Brazil.

ARTICLE I.—From the 11th of November of the present year, the clearance for consumption of merchandise, coming from foreign countries, and which may then, or shall thereafter, be stored in the custom houses, or stores belonging thereto, of the empire, shall be regulated in the following manner.

ARTICLE II.—Snuff or tobacco in powder, cigars, and paper ditto, and tobacco in rolls or leaf, shall pay sixty per cent.

ARTICLE III.—Bags made of hessens, or India sacking, knives in the shape of daggers, cushions for carriages, cut paving stones, stone door posts for coach houses, and for other doors and windows, cut stones for water-courses, “cepas,” and for cornices and corners of houses, refined sugar, ditto crystallised, or in any manner composed, tea, ardent spirits, beer, cider, gin, marasquino, or other liqueurs, and wine of whatever quality and produce shall pay fifty per cent.

ARTICLE IV.—Carpets, ordinary hessens or sacking, scales of whatever quality, and ready-made clothes, not specified in the tariff, playing cards, brushes, with ivory handles, Chinese fire-works on cards, or any other artificial fire-works, painted paper, ditto silver or gold, being of fine quality, paper for papering rooms; painted in groups or landscapes, large sized foolscap paper imperial ditto, or any other not specified in the tariff, powder, scented soap, common ditto, mould candles, composition (stearina) ditto, prunes, or any other fruit in glass bottles, or tin cases, either dry, preserved, or in spirits, chocolate made from ordinary cocoa, vinegar, gigs, carriages, or carriage-boxes, frames, wheels, harness for either one or the other, matting for houses, carts for carrying people, sociables, side saddles, porcelain, ink and sand stands, and any other article of crockeryware, not included in the tariff, chandeliers, liqueur or wine glasses, plain of ordinary glass (No. 1), those of either blown or cut glass ordinary, and the German ordinary cut, and such like (No. 2), those of plain glass, blown or cut, with cut or plain bottoms, ordinary (No. 3), champagne, or beer glasses, mugs, glasses (direitos), from ten to one in a quart, glass bottles holding a quart or more, all these articles being of No. 1 and 2; black or dark glass bottles holding the same quantity, including those which are used for liqueurs, or Le Roy; tavern glasses far as one “Canada” (seven-tenths of a gallon) flasks of ordinary glass with stoppers of the same up to three pounds or more, or without stoppers of two pounds or more, those with wide mouths with stoppers of the same to hold four pounds or more, or without stoppers for opodeldoc, glasses for lamps, planks of mahogany or any other fine wood, and furniture made of any wood whatsoever, shall pay forty per cent.

ARTICLE V.—All other articles, except the following, imported from foreign countries shall pay thirty per cent.

1st. Steel, tar, zinc in bar or sheet, lead in ditto, ditto pewter in bars or rods, iron in bars, rods, plates, or tongues for foundries, tin, nutgall, tin in sheets, brass in plates, ivory, saltpetre, withes, cod fish, stock fish, or any other, either dry or salt, biscuit, jerked or corned meat, aniseed, wheat, flour, white or coloured kid, calves’ skins for shoes, ditto varnished, pig skins, or ox-hides, green or dry, sole leather for shoemakers, or saddlers, copper, and copperas, all of which shall pay twenty-five per cent.

2nd. Wheat in grain, barilla, gold or silver wire, narrow gold or silver lace, wire covered with gold or silver thread (*fieras*), thread, fringe, spangles, gold lace (*patheta*), ribbon made of gold and silver wire (*passamanos*) being of second class gold or silver, ordinary or false, laces of the same kind or woven with sewing silk, linen thread, cotton or silk laces, or *entremozo* of plain cotton, net laces of cotton, silk, or twist (*torcal*), cambric handkerchiefs of cotton or linen, and silk sashes, all of which shall pay twenty per cent.

3rd. Books, maps, geographical globes, mathematical instruments, surgical or chemical ditto, dress pieces, velvets, or damasks worked with silver or fine gold, sewing silk or twist, and hair for hair dressers, shall pay ten per cent.

4th. Gold or silver wire (*canalitho*) thread cord, narrow lace, wire covered with gold or silver thread, thread, fringe, gold lace, spangles, gold lace (*patheta*), lace, tapes, and all other articles of this nature being of fine gold or silver shall pay six per cent.

5th. Coals, gold for gilding, or any silver articles and utensils, shall pay five per cent.

6th. Gold or silver jewellery, or any manufactured gold articles shall pay four per cent.

7th. Loose diamonds and other precious stones, seeds, plants, and new races of useful animals, shall pay two per cent.

ARTICLE VI.—All these duties shall be calculated either by taking the valuation marked in the tariff which is annexed to this regulation, of the article to be cleared, as often as the quantity referred to in the said valuation be contained in the merchandise about to be cleared, or upon the invoice value, sworn to and signed by the principals of the commercial houses who clear the goods, when the same shall not be reformed by the seizures (*impugnacoes*) of the regulation of the 22nd of June, 1836 (which may always take place in such cases), taking the hundredth part of it multiplied by the “quota” of the duties, when the merchandise shall not have any particular fixed valuation in the tariff, but only a note of ad valorem duties.

ARTICLE VII.—The duties hitherto paid for clearances of trans-shipment, or re-exportation,

are reduced to one per cent upon the value of the merchandise, but this reduction depends upon the definitive approbation of the general legislative assembly, and therefore all those persons who require such clearances before the said approval be given, must find good security, if the goods be cleared for the coast of Africa, for the payment of fifteen and a half per cent, besides the one per cent above referred to : and of two and a half per cent if for any other places out of the empire the said duties to be paid into the public coffers, should this reduction not be approved.

ARTICLE VIII.—These clearances shall be calculated by dividing the valuation of the merchandise to be trans-shipped or re-exported by the number which represents the relation in which it stands as regards the value of the said merchandise, and taking the quotient, wholly or in part as often as the unities or parts thereof may be contained in the duties to be paid, or by arbitration as laid down in the 213th article of the regulation above referred to, when the merchandise shall have no fixed valuation in the tariff. The clearances for trans-shipment or re-exportation to ports within the empire, which are now effected without paying the duties of consumption, are provisionally suspended until a better regulation be made on this subject.

ARTICLE IX.—The additional imposts for business of the office (*expediente*) and warehouse rent, hitherto paid upon merchandise, shall henceforward be included in the duties for consumption, and in order to comply with the law which orders the separate entry of this latter, twenty per cent shall be deducted at the end of each month from the whole amount of the taxes and duties for consumption, and the sum so deducted shall be divided into seven parts, two of which shall be considered as equivalent to the one per cent destined as a six monthly security for the interest on the loan in London, and the other five as equivalent to the two and a half destined for the destroying of paper currency.

ARTICLE X.—All merchandise, whether cleared for consumption, trans-shipment, or re-exportation, shall pay one quarter per cent on its respective value for each month it may remain in the warehouses of the custom-houses of the empire, which shall be calculated in the same manner as laid down in the eighth article for the clearances for trans-shipment and re-exportation, giving, however, fifteen days free to "Estiva" merchandise, that is, liquid, soap, &c., and two months to dry goods.

ARTICLE XI.—Notes for clearances must declare the foreign measure or weight reduced to Brazilian, without which they will not be distributed ; foreign measure in length (*de extencao*) must always be reduced to the Brazilian "vara," and the others to the measure or weight by which the valuation is fixed in the tariff upon merchandise to be cleared, and which it ought to pay, or to that measure or weight by which the article is commonly sold in the market, should the duties be marked in the tariff ad valorem.

ARTICLE XII.—The officer (*feitor*), to whom the clearance shall be given, must examine the reduction or weight, increasing or decreasing it as may be necessary ; he shall declare the quantity and inches which the goods have in width in "varas," or any other measure or weight, always *in extenso*. In the clearances of goods for which the duties must be paid per square "vara," the officer (*feitor*) must reduce them to this measure, and declare the number of square varas they contain, as well as the duty to be paid for each addition.

ARTICLE XIII.—In order to ascertain the number of square varas, the officer (*feitor*) after having found the exact number of single varas, will multiply this by the number of inches in the width of the article, and divide product by forty. The quotient obtained by this operation will show the exact number of square varas. For example, twenty-five varas of calico, being twenty inches in width,

$$\begin{array}{r}
 25 \\
 20 \\
 \hline
 40)500(12\frac{1}{2} \\
 \underline{480} \\
 20 \\
 \hline
 40=1\frac{1}{2}
 \end{array}$$

contains twelve and a half square varas.

In those articles which are not measured by the single vara, such as handkerchiefs and shawls, but upon which the valuation is imposed by the square vara, the officer (*feitor*) must take the length and width, and multiply one by the other ; and having obtained the number of square inches which each handkerchief or shawl contains, he must multiply it by the product of the length and width, and afterwards divide this product by 1,600, the quotient will give the number of square varas upon which the tax is to be calculated. For example, ten dozens of handkerchiefs, thirtieth inches square :

30
30
<hr/>
900
120
<hr/>
1,600)108,000(67½
96
<hr/>
120
112
<hr/>
8
<hr/>
16=½

The ten dozens, or 120 handkerchiefs, contain sixty-seven and a half square varas.

ARTICLE XIV.—When in the note for clearance any article shall be included which ought to pay ad valorem duties, the officer (*feitor*) after the quantity shall state how much per cent it ought to pay, and he shall enter in the column of imposts the value of the invoice, in order that the person who makes the calculation may, after deducting the duties, enter the amount in the column of imposts, making the following declaration at the end thereof: “I have examined the merchandise and entered the imposts (and awards for damage when there shall be any) or duties ad valorem according to the tariff. The person who makes the calculation must multiply the number of square varas, or any other measure, or weight by the imposts, enter their amount in the respective column, and sum up, and having also examined the reductions, shall enter the following declaration: “the additions and imposts or duties ad valorem agree, and it must pay for duties of importation and store rent *per extenso*.” Underneath the sum of the duties he must enter the amount to be paid for store rent, making the following declaration: “subject to store rent.” Another person must then examine the sums and calculations, and declare the sums and calculations agree, and must pay, namely,

Duties for consumption	dollars
Store rent	”

ARTICLE XV.—When any part of the goods submitted for clearance shall be damaged, two officers (*feitores*) named by the inspector, and in his presence shall proceed to make the examination, and declare the quantity damaged, and decide how much per cent shall be deducted from the impost on account of that damage. The officer (*feitor*) who makes the clearance, referring to this decision, marked with the initials of the inspector, shall declare the quantity damaged, and the deduction decided upon, and he shall enter the imposts in the respective column with the said deduction, for example:—

2400 square varas of coloured calico, impost in the tariff..... 8,400 reis.

88 ditto damaged, with twenty-five per cent deduction; impost awarded... 300 „

These declarations of award for damage shall be signed by the inspector, without which the “calculistas” shall not proceed with the clearance. Whenever deductions are made on account of damages, the first “calculista” shall declare on the margin of the clearance, the total amount of the said deductions to be taken from the duties, as in the case above referred to;—

Loss by award for damages at eight per cent..... 800 dollars.

ARTICLE XVI.—In the clearances of merchandise, the following points are to be observed:—

1. The value stated in the invoice shall include workmanship, precious stones and metals, and the whole shall be subject to seizure as well as other merchandise.

2. In the measurement of the goods, a quarter of an inch shall not be taken, but if it exceed that quantity it must be taken as half, and exceeding this latter, it must be considered as one inch.

3. In the notes for clearances, only the merchandise brought in one vessel shall be included; there must be as many notes as there may be vessels having merchandise to clear.

ARTICLE XVII.—The statistical returns, which must be drawn up in the custom-houses, shall declare the quantities cleared in square varas, or other measures, or Brazilian weights, for which purpose the officers (*feitores*) shall also declare in the clearances by invoice, the duties paid and the quantities deducted by award for damages.

ARTICLE XVIII.—Regarding the goods put up at auction for consumption in consequence of the length of time they may have been in the stores of the custom-house, beyond the time given by the regulations; and those sold before that time shall have expired because of their being generally damaged, verified by an examination made by the officers (*feitores*) according to the regulation now in force, the *ad valorem* duties shall be collected from the price obtained at the sale, if they should be so classed in the tariff; and when they are goods upon which the tariff imposes fixed taxes, thirty per cent shall always be collected upon the prices obtained at auction and not upon the fixed taxes.

ARTICLE XIX.—The stamp-duty established by the law of the 21st of October, 1843, shall be included in the imposts in the tariff.

ARTICLE XX.—The government is authorised to impose upon goods of any foreign nation which may put heavier duties upon Brazilian merchandise than upon that of a like nature of any other country, a differential duty, which may counteract the evil effect of the inequality, or oblige it to abolish that duty; but that differential duty shall cease immediately upon the cessation of the said inequality.

ARTICLE XXI.—A differential duty shall also be collected in the custom-houses of Brazil upon the merchandise of those nations which receive greater duties for consumption upon goods imported to their ports in Brazilian vessels, than upon those imported in their own ships, proceeding with them in the same manner, as with those mentioned in the foregoing Article.

ARTICLE XXII.—The duties or imposts in the present tariff shall not be increased within the financial year; but the government may order the payment in gold or silver, of the twentieth part of those which may be above six and less than fifty per cent of the prices of the merchandise, or even diminish them as may appear most requisite.

ARTICLE XXIII.—All laws contrary to the present are revoked.

Rio de Janeiro, August, 12, 1844.

(Signed)

MANOEL ALVES BRANCO.

NOTE.—The *rei* originally answered to the mill of our currency. *Milreis* signifies a thousand reis. The silver coin denominated milreis is nearly equivalent to a dollar. Gold and silver currency having now disappeared from Brazil, the paper milreis issued by the Bank of Brazil fluctuate in value according to the rates of exchange. The present value of the milreis is about fifty cents.

Commerce between Brazil and the United States.—The commerce between Brazil and the United States consists chiefly in the exchange of useful productions, the consumption of which is constantly on the increase. This circumstance gives reason to expect that the commerce between the two countries will continue to expand in the future as it has done heretofore, in proportion to their mutual increase of population.

It will be seen from the following tables, that the importations from Brazil to the United States have increased in twenty-one years from the value of 605,126 dollars to 948,814 dollars per annum. During the same period the exports from the United States to Brazil have increased from 1,381,760 dollars to 2,601,502 dollars.

The principal articles of importation from Brazil to the United States, are coffee, sugar, and hides. The principal exports to Brazil are flour and cotton manufactures. Numerous other articles are constantly exchanged between the two countries for their mutual convenience and benefit, but not in great quantities.

Brazil has already become one of the greatest coffee growing countries of the world. It supplies the United States with more than half of their annual importations of that article. Nearly all the commerce between the two nations is done by vessels belonging to the United States. The aggregate tonnage employed in 1841–42 in conveying exports to Brazil, was 38,773. That employed in making importations, was 37,038.

* The exports from Rio Grande were necessarily small, owing to the civil war in that province, and the greater part of the country in possession of the rebels; but in 1845 Rio Grande exported upwards of 1,000,000 of hides.

N.B. In the above official exposition, no mention is made of the value of the Exports to the *Coast of Africa*, but the amount is very considerable.

The value of the Gold Dust and Diamonds yearly exported by contraband, amounts, upon an average, to—Gold Dust, 1,000,000 rials, (or, 100,000*l.*); Diamonds, 5,000,000 rials, (or, 500,000*l.*).

Rio de Janeiro, August, 1846.

CHAPTER XV.

ARMY AND NAVY.

THE military staff is considered on an extensive and large scale. There is also supported a large corps of military police or gendarmerie, and a national guard. The national guard is organised by law; and all males from eighteen to forty-five years of age are enrolled in it. They are equipped at their own cost, the nation furnishing arms and ammunition. The national guard performs sentinel duty daily at the palace and public offices.

Captain Wilkes says, "The navy is not effective; they want seamen, and are not likely to have any. A naval academy is established for the education of cadets or midshipmen. Here they enter at twelve years of age, receiving some of the first rudiments of education, and remain four years. After passing an examination, they are sent to sea, serve there four years, and if found qualified are then promoted to second lieutenants.

"The military academy they enter later, remain seven years, passing through various courses of study, and if found competent, they are made lieutenants. From what I understood, the system of education is very imperfect."

STANDING ARMY.—The standing army of Brazil consisted, in 1844, of 24,244 officers and soldiers, viz. :—

	number.
Troops of the line.....	17,095
Volunteers and recruits.....	1,769
National guards in service.....	5,380

THE troops of the line in 1844, were distributed in the provinces as follows :—

COUNTRIES.	Men.	COUNTRIES.	Men.
	number.		number.

BOOK X.

MISCELLANEOUS CHAPTERS.

CHAPTER I.

TRADE AND NAVIGATION OF GREAT BRITAIN WITH CUBA, SPANISH AND AMERICAN REPUBLICS, AND BRAZIL.

THE progress of the trade of England with Cuba, Mexico, and the states of South America though comparatively limited by the condition of those countries is still of great importance.

The exports from England were

	1822.	1825.
	£	£
To Mexico	90,000	1,400,000
To Columbia	27,000	650,000
To Buenos Ayres	230,000	1,600,000
	<hr/>	
	347,000	
	3,303,000	
	<hr/>	
	3,650,000	3,650,000
Increase	£3,303,000	

According to the official accounts of the British custom-house the value of the exports of England to the new republics in 1824 amounted to the several values as follows, viz.:

	£
To the Brazils	3,425,324
To Spanish America	2,377,100
To the same destination, passing by the West Indies :	4,197,576
	<hr/>
Total exports of Great Britain to the new republics of America	10,000,000
According to the tables published by the French government, in the month of May, 1829, France exported to the new republics, goods to the value of	640,000
The United States	3,330,000
Spain, Germany, and other parts of Europe	4,480,000
China and the East Indies	1,150,000
	<hr/>
Total	19,600,000

These reports are exclusive of the important exports of British manufactures from the British West Indies to the Spanish American Republics.

CHAPTER II.

STATISTICS OF THE PRECIOUS METALS AND COINAGE OF THE SPANISH AMERICAN REPUBLICS.

BEFORE Humboldt wrote his "Political Essay upon New Spain," the reports circulated respecting the quantities of gold and silver exported from America all differed in their calculations. These discrepancies arose from their not possessing accurate data.

AUTHORS.	Epochs.	Value.	AUTHORS.	Epochs.	Value.
		dollars.			dollars.
Ustariz	1492 to 1724	3,536,000,000	Neckar	1763 to 1777	304,000,000
Solorzano	1492 to 1628	1,500,000,000	Gerboux	1724 to 1800	1,600,000,000
Moncada	1492 to 1505	2,000,000,000	The author of the "Investigation upon Commerce, Amsterdam, 1779."		
Navarette	1519 to 1617	1,536,000,000			
Raynal	1492 to 1718	5,154,000,000		1492 to 1775	5,072,000,000
Robertson	1492 to 1775	8,000,000,000			

According to Humboldt, the quantity of precious metals taken out of the mines of America is as follows:

From 1492 to 1500	marks.	From 1600 to 1700	marks.
" 1500 to 1545	3,000,000	" 1700 to 1750	22,500,000
" 1545 to 1600	11,000,000	" 1750 to 1803	35,300,000

He also gives the following recapitulation of the value of gold and silver taken from the mines of America from 1492 to 1803:

Registered from the Spanish colonies	dollars.	4,035,156,000
" " Portuguese ditto		684,544,000
Not registered from the first		616,000,000
" " second		171,000,000
Total		5,706,700,000

Of which Amount, during those 311 years the proportions furnished were as follows:

New Spain	dollars.	2,028,000,000	Chili	dollars.	188,000,000
Peru and Buenos Ayres		2,410,300,000	Brazils		835,530,000
New Granada		275,000,000			

He computes the annual product of the mines of the New World, at the commencement of the present century, as follows :

C O U N T R I E S.	Value.	Value.	Value.
	marks of gold.	marks of silver.	dollars.
New Spain.....	7,000	2,338,220	23,000,000
Peru.....	3,400	611,090	6,240,000
Chili.....	12,212	28,700	2,060,000
Buenos Ayres.....	2,200	481,830	4,850,000
New Granada.....	20,500	2,990,000
Brazil.....	29,900	4,369,000
Total.....	75,212	3,459,840	43,500,000

He calculated that the annual product of the European mines of Hungary, Saxony, and other places, and that of northern Asia, during the same period, amounted to nearly 5,000,000 more.

It is stated in an article on the precious metals in *Hunt's Merchant's Magazine* :

"The quantities of gold which America yielded at the commencement of this century, was, to the quantity of silver, in the proportion of one to forty-six; and in Europe, the proportion between gold and silver was as one to forty. The value of gold and silver, of equal quantities, was then in the proportion of fifteen to fifteen and a half of the latter, to one of the former. Finally, the quantity of gold produced, has augmented, in comparison, to the quantity of silver.

"From 1800 to 1810, the product of the American mines had a considerable increase, but, during the latter year, the contest commenced which resulted in the complete separation of the colonies from the mother country; and the convulsions and want of security caused by the struggle, likewise the proscription of the old Spanish families, the principal proprietors of the mines, who fled with the relics of their fortune to Spain, Cuba, Bordeaux, and other parts of the south of France; caused the abandonment of several mines, and a very extraordinary diminution in the amount of their product. We have not the means to calculate with precision the exact extent of this decadence."

According to Mr. Ward, in Mexico, from the year 1811 to 1828, the average of the coined metals was only 10,000,000 dollars a year; while, in 1810, it had risen to 26,500,000 dollars.

Mr. Jacob computed the total product of the American mines, including those of Brazil, during the twenty years terminating in 1829, at 379,937,731 dollars, or 18,996,845 dollars yearly; which is considerably less than half the amount which was produced at the beginning of this century.

Storch, in correcting the calculations of Humboldt, computes that the circulation of metals in Europe, which in 1815 amounted to 1,320,000,000, in 1830, was increased to 1,600,000,000; being, in a great measure, on account of England withdrawing her paper money, and resuming cash payments; and likewise through Russia, Austria, Norway, Sweden, Denmark, and the United States, having followed her example; besides the consumption of gold and silver, wrought up into plate, jewels, and other artificial objects, having considerably augmented.

Mr. Jacob estimates the value of the precious metals which are annually destined for ornaments of luxury (*objets de luxe*), as follows :

	£
Great Britain.....	2,457,221
France.....	1,200,000
Switzerland.....	350,000
The rest of Europe.....	1,605,499
And that which is calculated for the same objects in America.....	287,280
Total.....	5,900,000

We consider this computation little more than conjecture.

M. Chabrol calculates that the annual consumption of gold and silver in Paris, for the use of works of art, amounts to 14,552,000 francs, or 582,480*l.* sterling a year; this corresponds with the calculation of M. Benoiston de Chateauneuf: both parties agreeing that the consumption of precious metals in Paris, in objects of art, is double that of the rest of France; the consumption of the whole kingdom being 21,825,000 francs, or 873,000*l.*;—that is to say 327,000*l.* sterling a year less than the calculation of Mr. Jacob.

Mr. M'Culloch estimates the consumption of the precious metals in works of art, as follows:

	£
Great Britain.....	1,842,916
France.....	866,190
Switzerland.....	355,000
The rest of Europe.....	1,204,118
America.....	300,000
Total.....	4,568,224

This computation is probably still too high. According to Humboldt, the total consumption of precious metals in Europe, for other objects besides that of coinage, amounts to 17,436,400 dollars; and, adding to this amount 1,411,764 dollars, fifty-five cents, for the consumption of America, the total sum would be 18,848,164 dollars, which is 2,821,889 dollars less than the calculation of M'Culloch, and no less than 8,919,641 dollars under that of Mr. Jacob. We, however, consider all these estimates based on vague data.

A London periodical, the *Mining Journal*, estimates that, "In forty years, from 1790 to 1830, Mexico produced 6,436,453*l.* worth of gold, and 139,817,032*l.* of silver; Chile, 2,768,488*l.* of gold, and 1,822,924*l.* of silver; Buenos Ayres, 4,024,895*l.* of gold, and 27,182,673*l.* of silver; Russia, 3,703,743*l.* of gold, and 1,500,971*l.* of silver. Total, 187,257,179*l.* sterling, or 4,680,429*l.* 9*s.* 7*d.*, per annum."

Produce of the Gold Mines in the Ural Mountains and in Siberia, derived from official sources.

Of the total quantity of gold extracted in 1846 from the mines belonging to the crown, and to private individuals situate in the Ural Mountains and in Siberia, the Royal Mint received 1397 poods, 15 lbs., and 13 solotnicks; and during the course of the winter about 325 poods, 14 lbs., and 74 solotnicks more are expected to be transmitted to the mint, which will make the total produce of the mines for the year 1846, amount to 1722 poods, 29 lbs., and 87 solotnicks.

Formerly the gold was sought for only in the neighbourhood of the mines of Katherineburg, belonging to the crown; in the mines of Bérézoff; and in the country adjacent to the mines of Kolyvano, Voskresseusk, and of Nertchinsk. This gold was extracted from the silver which the mines produced, but the total quantity did not amount annually to more than from 31 to 40 poods' weight.

In the year 1819 beds of auriferous sand were discovered in the Ural mountains. The following table shows the quantity of gold extracted in the year 1819 to 1828, inclusive:

Y E A R S.	Quantity.	Weight.	Solotnicks.
	poods.	lbs.	number.
1819.....	49	9	55
1820.....	44	3	
1821.....	52	24	85
1822.....	79	21	36
1823.....	125	19	79
1824.....	228	13	118
1825.....	257	12	54
1826.....	257	25	15
1827.....	307	30	95
1828.....	317	39	44
Total.....	1711	21

In 1829 the discovery was made of the beds of auriferous sand in Siberia. In the first instance the produce was but small, but subsequently, and more particularly during the last six years, the results were brilliantly successful, as may be seen by the following table :

Y E A R S.	Quantity.	Weight.	Solotnicks.
	poods.	lbs.	number.
1829.....	314	31	1
1830.....	378	15	79
1831.....	396	29	37
1832.....	410	8	61
1833.....	408	22	71
1834.....	406	4	64
1835.....	413	1	8
1836.....	426	3	74
1837.....	469	29	75
1838.....	524	36	69
1839.....	525	5	38
1840.....	585	15	50
1841.....	681	20	34
1842.....	950	26	68
1843.....	1,283	2	60
1844.....	1,341	25	60
1845.....	1,386	6	41
1846.....	1,722	29	87
Total.....	12,624	28	24

Since the discovery of the beds of auriferous sand, namely, since the year 1819, the total quantity of gold extracted from the Ural mountains, as well as from Siberia, amounts to 14,335, poods, 28 lbs., and 45 solotnicks, of which quantity 2924 poods, 24 lbs., and 32 solotnicks was produced from the crown mines in the Ural mountains; 1293 poods, 7 lbs., 28 solotnicks from those in Siberia; and 4219 poods, 39 lbs., 79 solotnicks from the mines belonging to private individuals in the Ural mountains, and 5897 poods, 37 lbs., 11 solotnicks from those in Siberia.

The produce of the gold mines in the year 1846, which amounted, as before stated, to 1722 poods, 29 lbs., 87 solotnicks, forms more than a tenth part of the total quantity of gold extracted, since the year 1819, from all the mines in Russia, and exceeds by 336 poods, 23 lbs., 46 solotnicks the total quantity for the year 1845.

See Statistics of the Coinage, &c. Vol. II. p. 1174, for an account of the gold mines and coinage of the United States.

The following statements are condensed from the official returns received by her majesty's government from Mexico and South America.

Total.....	16,399,583 85 £3,279,916 15s.

NOTE.—The first coinage of small money commenced in 1835; it contains from 33 to 36 per cent of alloy, and is exclusively used for the interior circulation of Bolivia and of the neighbouring provinces of North and South Peru. The Bolivian dollar contains the same proportion of pure silver as the old Spanish dollar, and the small money only 66 per cent of that metal.

La Paz, July 1, 1838. (signed) J. B. PENTLAND.
Pure or refined silver contains 12 dwts., and the standard for coinage in Bolivia is 10 dwts. 20 grains; consequently standard silver contains 260 parts of pure silver and 23 parts of alloy.
Since the year 1830, however, all the silver coins issued from the Mint of Potosi, with the exception of dollars, have been of the standard of 8 dwts., about 26 per cent less than the national standard; and although the annual issue of this small and base coin is nominally restricted to 200,000 dollars, equal to 40,000*l.*, this regulation is not always adhered to; thus, in 1835 its issue amounted to 509,090 dollars 4 cents, equal to 101,818*l.* 2*s.*; in 1836 to 303,186 dollars 4 cents, equal to 606,377 6*s.*, and in 1837 to 301,563 dollars, equal to 60,312*l.* 12*s.*
Her Majesty's Legation, Lima, April 18, 1838. (signed) BELFORD HINTON WILSON.

* The denominations after marcos (marks) follow in this order; onzas, ochavas, tomines, grains.

Office of the Mint at Popayan, 23rd of January, 1834. JOSE J. CARBAJAL.

NOTE.—Of the 184,035 dollars, value of silver coined, two-thirds were in old silver.
All the rest of the silver after 1810, and nearly all before, was the produce of plate and old coin sold to the mint. Very little silver was ever sent from the mines to Popayan before 1810, and none after; nor do the sums enumerated as having been coined there during the whole period, include the annual 2,000 dollars stated in the Note in the Bogota Tables to have been extracted from gold, as the gold produced by the mines, whose produce was sent to Popayan, contained no silver. Nearly the whole, therefore, of the silver bought and coined by the mint of Popayan, was the produce of plate ornaments and old money sold.—W. T.

Colombian Measures of Gold and Silver.

1 Marco	1 lb. Spanish	8 oz.	1 Mark
1 lb. Spanish	16 oz. Spanish, or 100 Castellanos.	8 Ochavas	1 oz.
8 Tomines	1 Castellano.	6 Tomines	1 Ochava
1 oz. Spanish	444 grains English.	12 Grains	1 Tomin
1 oz. Troy	480 grains English.		

Of a mark of gold are coined 136 dollars, in conformity with the Colombian law of 1821.
The Spanish Ordenanza enacted that 8½ dollars should be coined from a mark of silver of 11 dineros of fineness.—W. T.

REMARKS.—It has not been possible to procure a return of the amount of gold raised in Peru for the same period. No gold was coined at the mint of Cuzco prior to the year 1836. Pure gold is 24 carats. The standard for gold coinage in Peru is 21 quilates (carats), or 21 parts of pure gold to three parts of alloy. A marc (of eight ounces) of gold on being brought to this standard (21 carats), either by adding to or subtracting from its fineness when introduced at the mint, is made to produce in gold coin 144 dollars 4 rials, or 281.18s.; but as the mint only pays to the introducer of a bar at the rate of 129 dollars 7½ rials, or 251.19s. 9d. the marc of 21 carats, there results a profit to that establishment of 14 dollars 4½ rials, or 21.18s. 6d. on each marc; which added to the 129 dollars 7½ rials, or 251.19s. 9d., completes the 144 dollars 4 rials, or 281.18s., its product in coined money. The average value of gold of 21 carats, if purchased on board, is 136 dollars, equal to 271.4s. the marc (eight ounces); thereby effecting a saving in favour of the smuggler of 8 dol-

bars 4 real, equal to 1*l*. 14*s*. The greater proportion therefore of the gold produced in the country is smuggled out of it in the shape of bullion; in that state its exportation being altogether prohibited. The current gold coins of Peru are as follow:—

Exchange at 4 <i>s</i> l. per dollar.		
	£ s. d.	dlrs. rs.
Doblon of 8 escudos.....	1 ounce	17 0 equal to 3 8 0
— of 4 ditto.....	½ "	8 4 " equal to 1 14 0
— of 2 ditto.....	¼ "	4 2 " equal to 0 17 0

A marc of gold, according to Castilian weight contains eight ounces (355*g*) grains troy, each ounce eight ochavas, each ochava two adarmes, each adarme (27 738-1000 grains troy) three tomines, and each tomin twelve granos. But as a marc of gold, when coined, produces eight coins of eight escudos each, or seventeen dollars, equal to 3*l*. 8*s*., and one coin of four escudos, or 8 *dlrs.* 4*rs.*, equal to 1*l*. 14*s*., each of the eight coins should weigh 15 1-17 adarmes, equal to 12-17 grains troy, or 417 12-17 grains; and the remaining coin 7 15-34 adarmes, equal to 8 *dlrs.* 16 29-34 grains, or 208 29-34 grains troy; with difference occasioning a profit to the mint of a doblon of four escudos, equal to 8 dollars 4*rs.* equal to 1*l*. 14*s*., on each mark of gold there coined. The same proportion, with the difference of value between the two metals, is observed in the coinage of silver. But in the gold coinage a variation or fable, in the following proportion is permitted; on a marc of gold 6 grains, on an ounce of gold 1½ grains, on a marc of silver, on the four, two, and one dollar pieces ½ of a grain each.—Lima, July 30, 1856.

RETURN of the Number of Marcs of Silver, of Eight Ounces, reduced to Bars at the different Smelting Houses of Peru, herein specified, during the Years 1790 to 1819, both inclusive, so far as it has been possible to procure the same.

The anarchy and the rebellions which have disordered the Spanish American Republics, have rendered it impossible to procure recent accounts of the produce of the mines; and we have been unable to procure any account of the produce of the Brazilian mines, upon which any reliance can be placed. The produce of the precious metals from all the mines in the world, is but very imperfectly known; and the foregoing tables contain, we believe, all the information of any consequence that has been officially ascertained.
